Creating Universal Template Field Choices

The information on these pages also is located in the Universal Controller 6.4.x Tasks.pdf.

## **Universal Tasks Overview**

- Overview
- Universal Task User-Defined Fields
- Setting Up Universal Templates and Tasks

### Overview

Universal Task allows Universal Controller users to implement task types that are specific to their own in-house applications, utilities, or third-party vendor applications.

In cases where you are using a generic script with a Windows or Linux/Unix Universal Agent-based task, you now can create a customized Universal Task Details that encapsulates the specific input needed for that command or script.

Universal Tasks are created for specific Universal Task types, which are based on Universal Templates. When a Universal Template is created, Universal Controller creates a corresponding Universal Task type - <template name> Tasks - under the Universal Tasks folder in the Automation Center navigation pane.

#### Note

The Universal Tasks folder appears in the Automation Center navigation pane only when both of the following have occurred:

- A Universal Template has been created and one or more fields have been defined for the template.
- The Automation Center navigation pane has been refreshed.

Each Universal Template contains user-defined fields, to which the Controller assigns a variable to be used in the Universal Template script. The Controller also automatically adds these fields to the Details of all Universal Tasks created for the Universal Task type based on that Universal Template. When a Universal Task is run, it executes the script in the Universal Template and the variables in the script are resolved to the values of their matching fields in the Universal Task instance.

In this way, you can execute the same script from different tasks and have the script variables resolve to different values.

If you want to change the script, including the adding or removing variables, you only have to change it in the Universal Template.

## **Universal Task User-Defined Fields**

The Details for each Universal Task contains any editable fields that were created in the Universal Template on which the Universal Task type for that Universal Task is based. System-assigned variables that match these fields are provided for inclusion in the template script. When the task is run, it executes the script, and the variables are resolved to the values of their matching values in the task.

There are six types of user-defined fields that can appear in the Details of a Universal Task:

- Text
- Integer
- Boolean

- Choice
- Credential
- Script

For each type of field, default values, format, and/or limitations are specified in the Universal Template. In any Universal Task based on that Universal Template, you can override and/or define values - within the specified format and limitations - for those fields.

# **Setting Up Universal Templates and Tasks**

Step 1	Create a Universal Template, which includes selecting the type of Agent(s) on which Universal Tasks based on this Universal Template can be run, and a variable prefix used for script variables that you want resolved when a Universal Task executes the script in this Universal Template.
Step 2	Enter a script in the Universal Template that all Universal Tasks based on this Universal Template will execute when they are run.
Step 3	After you have entered/selected any other desired values in the Universal Template Details, save the Universal Template.
Step 4	For each parameter in the script that you want to replace with a variable, create a Universal Template Field of an appropriate Field type. The Controller automatically assigns a variable (format: ops_ <variable prefix="">_<field name="">) to each Field, using the variable prefix that you specified in Step 1, and - in the Details of all Universal Tasks based on this Universal Template - will place fields that match these Universal Template Fields (see Step 7).</field></variable>
Step 5	Replace the appropriate parameters in the script with the system-assigned variables.
Step 6	Update the Universal Template. Now that the Universal Template has one or more defined Fields, the Controller creates a Universal Task type for it and adds the Universal Task type to the Automation Center navigation pane. (You must refresh the Automation Center navigation pane in order to see the new Universal Task type.
Step 7	Create a Universal Task for that Universal Task type. The Universal Task Details will contain fields that match the Fields you created in the Universal Template (Step 4) for that Universal Task type.
Step 8	Enter/change values in the Universal Task fields that match the Universal Template Fields, based on how you want their matching variables in the script to be resolved.
Step 9	Run the task, which executes the script. The variables in the script are resolved to the values of their matching fields in the Universal Task.

## **Creating a Universal Task**

- · Before You Begin
- Built-In Variables
- · Creating a Universal Task
  - Universal Task Details
  - Universal Task Details Field Descriptions
- Viewing a Universal Task Instance
  - Universal Task Instance Details
  - Universal Task Instance Details Field Descriptions
- Additional Task and Task Instance Details
- Running a Universal Task
- Monitoring Task Execution

## **Before You Begin**

Universal Task allows you to run a platform-specific application on a Linux/Unix or Windows machine. To run a Universal task, you must first complete the following tasks:

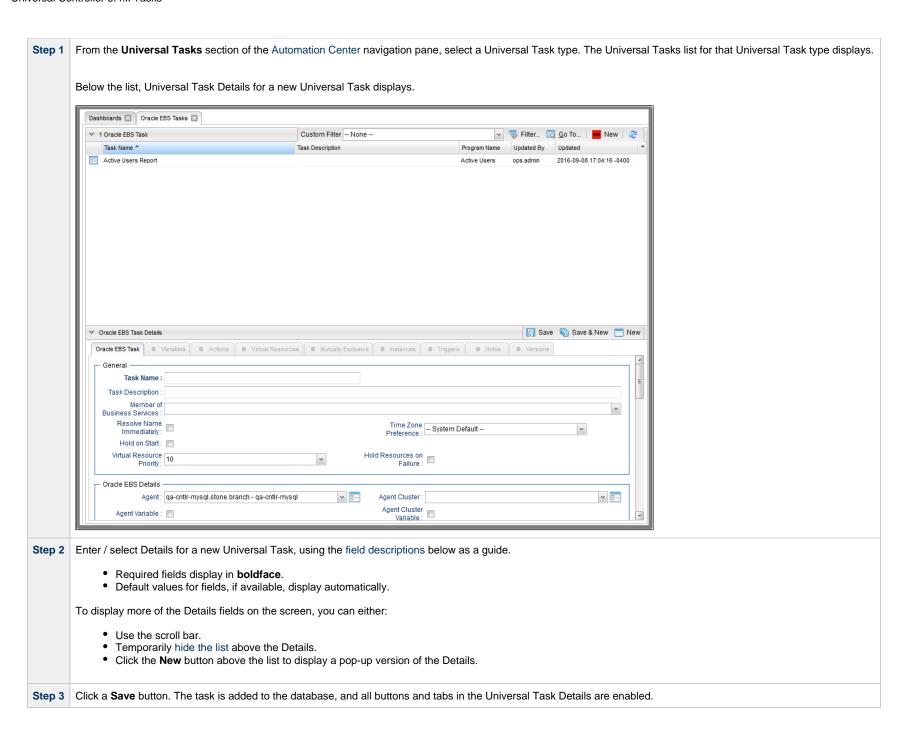

- Install Universal Agent for Linux/Unix on a Linux/Unix machine and/or install Universal Agent for Windows on a Windows machine.
- · Launch the Agent(s). When an Agent connects with the Controller, it automatically creates an Agent resource definition in the database.
- Optionally, customize the Agent heartbeat and log levels, as described in:
  - Linux/Unix Agent Details Field Descriptions.
  - Windows Agent Details Field Descriptions

## **Built-In Variables**

In addition to the system-assigned variables in the Universal Template script that a Universal task executes, the following built-in variables can be used in a Universal task to pass data where appropriate:

- Agent-Based Task Instance variables
- Task Instance variables

## **Creating a Universal Task**

#### Note

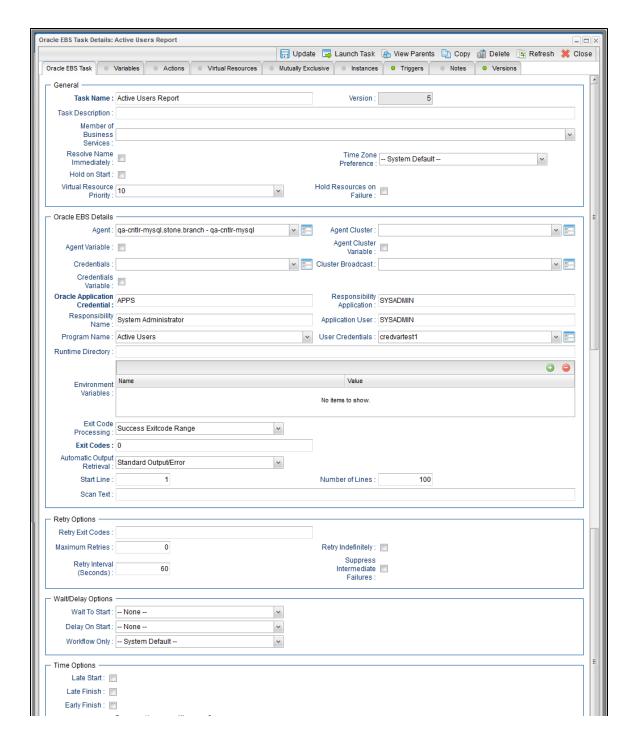

To open an existing record on the list, either:

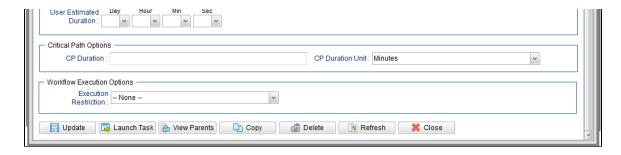

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click Open In Tab in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

## **Universal Task Details**

The following Universal Task Details is for an existing Universal task.

Depending on the values that you enter / select for these fields, and whether or not the Universal Task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the Universal Task Details.

## **Universal Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the Universal Task Details.

Field Name	Description
General	This section contains general information about the task.
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.

Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:
	<ul> <li>System Default –         Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxx)         Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.</li> <li>Inherited         Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.</li> </ul>
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.
Hold Reason	Information about why the task will be put on hold when it starts.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Details	This section contains assorted detailed information about the task.
Agent	Name of the Agent resource that identifies the machine where the operation will run. If you do not specify an Agent, you must specify an Agent Cluster.
Agent Cluster	Group of Agents, one of which the Controller will choose to run this task (compare with Cluster Broadcast). You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.

#### Agent Variable

Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the **Agent Variable** field to **Yes** and specify the Agent variable in the **Agent Unresolved** field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the **Agent Variable** field to **No** and specify the Agent reference in the **Agent** field.

#### Agent Cluster Variable

Indication of whether the Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using an Agent Cluster reference to using an Agent Cluster variable, you must change the **Agent Cluster Variable** field to **Yes** and specify the Agent Cluster variable in the **Agent Cluster Unresolved** field. Conversely, to change from using an Agent Cluster variable to using an Agent Cluster reference, you must change the **Agent Cluster Variable** field to **No** and specify the Agent Cluster reference in the **Agent Cluster** field.

#### Credentials

Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.

If the user does not have a login shell, add a - character in front of the runtime credentials name. The Controller will provide a shell for that user and strip the - character from the name.

Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

#### Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials**Variable field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

#### Cluster Broadcast

Group of Agents, all of which will run this task (compare with Agent Cluster). You can specify a Cluster Broadcast in place of a specific Agent and/or agent cluster. Each instance of the task running on its own Agent becomes a separate task instance record in the database and displays separately on the Activity Monitor.

# Run with Highest Privileges

For Windows Agents; Execute the task using an elevated privileges token, rather than one subject to User Account Control (UAC) restrictions. An elevated token allows a process to execute with all the privileges available to its specified credentials. For example, a task executed with an administrative account will behave as though it received permission via a UAC dialog to perform a privileged operation.

This option will **not** give a user account privileges that have are not already granted to it. For example, taking ownership of a file is a privileged operation by default. A task will still fail even with this option selected if it is run with a regular user account that has not been granted the ability to change file ownership.

#### Note

This option only will affect tasks executed on Windows systems that support User Account Control (UAC). It will have no affect on tasks run on Windows releases prior to Vista (for example, Windows XP, Server 2003).

#### (user-defined fields)

These are the user-defined fields in the Universal Template on which this task is based.

There are six types of user-defined fields:

- Text
- Normal text (for a single line of text)
- Large Text (for multiple lines of text)
- Integer
- Boolean
- Choice
- Credential
- Script

Default values and maximum lengths of these fields is specified in the Universal Template.

#### Runtime Directory

Directory from which the application should be executed. Variables supported.

#### Interact with Desktop

For Windows Agents; Specification that a Universal Task running an application with a GUI will require some manual actions from a user (for example, clicking buttons or entering values).

#### Note

This option is effective only for tasks executed on Windows XP or Server 2003. Windows Vista introduced the desktop isolation feature, which prevents tasks from accessing the interactive desktop session on Vista, Windows 7, Server 2008, Windows 8, and Server 2012. The Windows agent will execute the task, but the **Interact with Desktop** option has no effect. Therefore, an interactive application's GUI will not be visible on those platforms.

#### Create Console

If Interact with Desktop is enabled; Allocates a new console for the process, rather than having it inherit one.

Environment Variables	Allows you to enter environment variables needed by the program to run.
	To add a variable, click the + icon and enter a Name and Value. To delete a variable, select in the list of variables and click the - icon.
	You can add a maximum of 4,000 characters for the combined Names and Values of all variables. The variable is listed in the space underneath.
Exit Code Processing	Specifies how the Controller should determine whether the executed command failed or completed successfully.
	Options:
	<ul> <li>Success Exitcode Range         Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field.</li> <li>Failure Exitcode Range</li> </ul>
	Command is considered failed if its exit code falls within the range specified in the Exit Codes field.  • Success Output Contains  Command is considered completed successfully if its output contains the text specified in the Scan Output For field.
	<ul> <li>Failure Output Contains</li> <li>Command is considered successfully if its output contains the text specified in the Scan Output For field.</li> </ul>
	<ul> <li>Step Conditions (z/OS only)</li> <li>Command is considered completed successfully/failed if any of its specified condition codes falls within the range specified under the Step Conditions tab (see Creating Step Conditions).</li> </ul>
Output Type	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output.
	Options:
	<ul> <li>Standard Output (STDOUT)</li> <li>Standard Error (STDERR)</li> <li>File</li> </ul>
Scan Output For	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this field as a regular expression.
Output File (for Exit Code Processing)	Required if Output Type = File; path and file name of the output file that should be scanned for the text in the Scan Output For field.
Exit Codes	Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.

Automatic Output Retrieval	Specifies whether you want the Controller to automatically retrieve any output from the job and attach it to the task instance record.
	Options:
	<ul> <li>None Do not attach any output to the task instance record.</li> <li>Standard Output Attach all standard output.</li> <li>Standard Error Attach standard error output.</li> <li>File Attach the file specified in the Output File field.</li> <li>Standard Output/Error Attach all standard output and standard error output.</li> </ul>
	Note Tasks specifying Automatic Output Retrieval will fail with Start Failure if the Agent Output Prohibited field is true in the Details of the specified Agent.
Start Line	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Instructs the Controller to retrieve data beginning at the line indicated.  • If a <b>Start Line</b> value is not specified, the default is 1.  • If the <b>Start Line</b> value is -1, data will be retrieved starting at the end of the file.
Number of Lines	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Allows you to limit the retrieved data to the number of lines specified. If a Number of Lines value is not specified, the default is the value of the Retrieve Output Default Number Of Lines Universal Controller system property.
Scan Text	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Regex pattern that the Controller will search for a match for in STDOUT/STDERR or a specified file. The Controller will include the <b>Number of Lines</b> above and below the first line matched.  if the Regex pattern is not found, the following message is returned: OPSWISE WARNING - Scan text string not found.
Output File (for Automatic Output Retrieval)	Required if Automatic Output Retrieval = File; path and file name containing the output that you want automatically retrieved and attached to the task instance.
Retry Options	This section contains specifications for retrying the task.
Retry Exit Codes	Exit code range for which an auto-retry of tasks in FAILED status will occur. Exit code ranges must be in the same format as ranges specified in the Exit Codes field. Maximum Retries must be greater than 0.
	If this field is empty, any exit code potentially will cause a retry.

Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval (Seconds)	User-defined; number of seconds between each retry.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:  • All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.  • Workflow conditional path processing; any Successors waiting on a failure path will not be released.  • Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which Suppress Intermediate Failures has been enabled.  • Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.  Options are:  - None -  Time Relative Time Duration Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	<ul> <li>- None</li> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> </ul>
	<ul> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> </ul>
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.
Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.
	Options are:
	<ul> <li>None –</li> <li>Duration</li> <li>Seconds</li> </ul>

Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  Options are:  System Default Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.) - Yes Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow No Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
	Valid values:
	Tuesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Tuesday, advance to next Wednesday.  Tuesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Tuesday, advance to next Tuesday.  Thursday If today is not Tuesday, advance to next Tuesday.  Thursday If today is not Tuesday, advance to next Tuesday.  Thursday If today is not Tuesday, advance to next Tuesday.  Thursday If today is not Tuesday, advance to next Thursday.  Thursday If today is not Friday, advance to next Friday.  Saturday If today is not Saturday, advance to next Saturday.  Nth Day Advance to a specific number of days in the future.
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.  For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.  For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Late Finish Type	Required if Late Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.
	Valid values:
	<ul> <li> None Advance to the next day if the specified late finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day</li> </ul>
	Advance to the next day.  Next Business Day Advance to the next business day. Sunday
	If today is not Sunday, advance to next Sunday.  • Monday If today is not Monday, advance to next Monday.  • Tuesday  —
	<ul> <li>If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday</li> <li>If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday</li> </ul>
	If today is not Thursday, advance to next Thursday.  • Friday  If today is not Friday, advance to next Friday.
	<ul> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul>
	Default is – None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.
Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.

Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	Valid values:  - None - Advance to the next day if the specified early finish time is before the Created time of the task instance. Same Day Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Wednesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Thursday If today is not Thursday, advance to next Thursday. Thursday If today is not Thursday, advance to next Thursday. Thursday If today is not Thursday, advance to next Friday. Saturday If today is not Saturday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future.  Default is - None

Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds Minutes Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.

Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.  Options are:  None No restriction for this task Run Restriction for when this task will be run Skip Restriction for when this task will be skipped Hold Restriction for when this task will be held.  If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.
Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.  Options are:  • - None - No period of restriction for this task. • Before Restriction is valid if the date is before the Before Date value. • After Restriction is valid if the date is after the After Date value. • Span Restriction is valid if the date is before the Before Date value and after After Date value. • On Restriction is valid if the date is one of the Date List values.
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for task instances of the task.

First Time Ran	System-supplied; date and time this task first ran.
Last Time Ran	System-supplied; date and time the task last ran.
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.
Lowest Instance Time	System-supplied; shortest amount of time this task has taken to run.
Average Instance Time	System-supplied; average amount of time this task takes to run.
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.
Number of Instances	System-supplied; number of instances in the database for this task.
Buttons	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Save	Saves a new task record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new task.
Update	Saves updates to the record.
Launch Task	Manually launches the task.
View Parents	Displays a list of any parent Workflow tasks for this task.
Сору	Creates a copy of this task, which you are prompted to rename.

## Delete Deletes the current record. Note You cannot delete a task if it is either: Specified in an enabled Trigger. The only task specified in a disabled Trigger. Refresh Refreshes any dynamic data displayed in the Details. Close For pop-up view only; closes the pop-up view of this task. This section identifies the tabs across the top of the Task Details that provide access to additional information about the task. **Tabs Variables** Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record. Actions Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task. Events are: Task instance status Exit codes Late start Late finish Early finish Actions are: Abort the task if certain events occur. For details, see Abort Actions. **Abort Action Email** Send an email if certain events occur. For details, see Email Notification Actions. Notification **Set Variable** Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow. SNMP Send an email if certain events occur. For details, see SNMP Notification Actions. Notification System Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions. Operation **Virtual Resources** Lists all Virtual Resources to which this task is assigned.

Mutually Exclusive	Lists all tasks that have been set to be mutually exclusive of this task.
Instances	Lists all instances of the task.
Triggers	List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current name="" task="">#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers.</current>
Notes	Lists all notes associated with this record.
Versions	Stores copies of all previous versions of the current record. See Record Versioning.

# **Viewing a Universal Task Instance**

When a Universal Task is launched, the Controller creates a task instance record of that task.

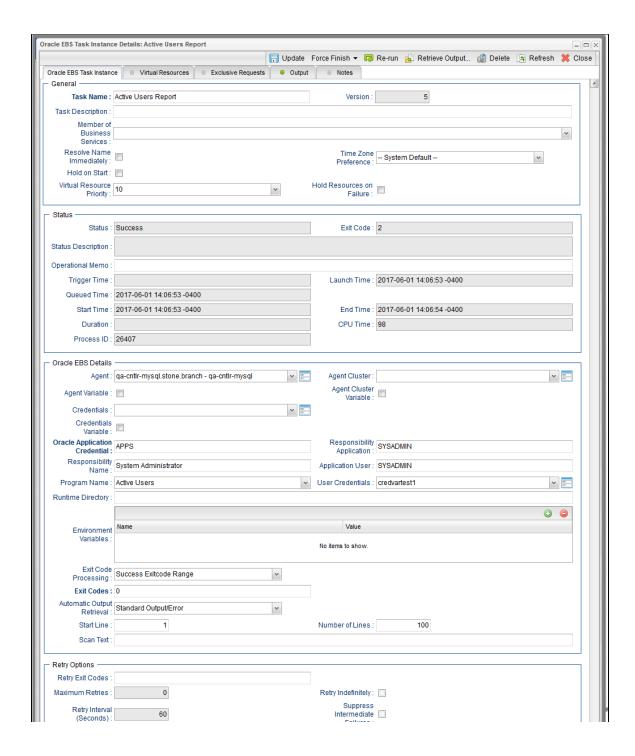

A task instance contains detailed information about a single execution of that task.

You can access a task instance from:

- Instances tab on the Universal Task Details for that task
- Activity Monitor
- Task Instances list

## **Universal Task Instance Details**

The following Universal Task Instance Details contains information on the execution of the task shown in the Universal Task Details.

# **Universal Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in Universal Task Instance Details.

Field Name	Description
General	This section contains general information about the task instance.
Instance Name	Name of this task instance.
Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.
Invoked by	System-supplied; how the task instance was launched.  Options:  Trigger: (Trigger Name)     Instance was launched by the named trigger.  Workflow: (Workflow Name)     Instance was launched by the named workflow.  Manually Launched     Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.

Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)

Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.
End Time	System-supplied; Date and time the task instance completed.
Duration	System-supplied; amount of time the task instance took to run.
CPU Time	System-supplied; amount of CPU time the task took to run.
Process ID	System-supplied; ID of the process that was launched.
Universal Details	This section contains assorted detailed information about the task instance.
Agent	Name of the Agent resource that identifies the machine where the operation will run. If you do not specify an Agent, you must specify an Agent Cluster.

#### Agent Variable

Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the **Agent Variable** field to **Yes** and specify the Agent variable in the **Agent Unresolved** field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the **Agent Variable** field to **No** and specify the Agent reference in the **Agent** field.

#### Agent Cluster

Group of Agents, one of which the Controller will choose to run this task (compare with Cluster Broadcast). You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.

#### Agent Cluster Variable

Indication of whether the Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using an Agent Cluster reference to using an Agent Cluster variable, you must change the **Agent Cluster Variable** field to **Yes** and specify the Agent Cluster variable in the **Agent Cluster Unresolved** field. Conversely, to change from using an Agent Cluster variable to using an Agent Cluster reference, you must change the **Agent Cluster Variable** field to **No** and specify the Agent Cluster reference in the **Agent Cluster** field.

#### Credentials

Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.

If the user does not have a login shell, add a - character in front of the runtime credentials name. The Controller will provide a shell for that user and strip the - character from the name.

Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

#### Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials**Variable field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

# Run with Highest Privileges

For Windows Agents; Execute the task using an elevated privileges token, rather than one subject to User Account Control (UAC) restrictions. An elevated token allows a process to execute with all the privileges available to its specified credentials. For example, a task executed with an administrative account will behave as though it received permission via a UAC dialog to perform a privileged operation.

This option will **not** give a user account privileges that have are not already granted to it. For example, taking ownership of a file is a privileged operation by default. A task will still fail even with this option selected if it is run with a regular user account that has not been granted the ability to change file ownership.

#### Note

This option only will affect tasks executed on Windows systems that support User Account Control (UAC). It will have no affect on tasks run on Windows releases prior to Vista (for example, Windows XP, Server 2003).

#### (user-defined fields)

These are user-defined fields in the Universal Template on which this task is based.

There are six types of user-defined fields:

- Text
- Normal text (for a single line of text)
- Large Text (for multiple lines of text)
- Integer
- Boolean
- Choice
- Credential
- Script

#### Runtime Directory

Directory from which the application should be executed. Variables supported.

#### Interact with Desktop

For Windows Agents; Specification that a Universal Task running an application with a GUI will require some manual actions from a user (for example, clicking buttons or entering values).

#### Note

This option is effective only for tasks executed on Windows XP or Server 2003. Windows Vista introduced the desktop isolation feature, which prevents tasks from accessing the interactive desktop session on Vista, Windows 7, Server 2008, Windows 8, and Server 2012. The Windows agent will execute the task, but the **Interact with Desktop** option has no effect. Therefore, an interactive application's GUI will not be visible on those platforms.

#### Create Console

If Interact with Desktop is enabled; Allocates a new console for the process, rather than having it inherit one.

#### **Environment Variables**

Allows you to enter environment variables needed by the program to run.

To add a variable, click the + icon and enter a Name and Value. To delete a variable, select in the list of variables and click the - icon.

You can add a maximum of 4,000 characters for the combined Names and Values of all variables. The variable is listed in the space underneath.

Exit Code Processing	Specifies how the Controller should determine whether the executed command failed or completed successfully.
	Options:
	<ul> <li>Success Exitcode Range Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field.</li> <li>Failure Exitcode Range Command is considered failed if its exit code falls within the range specified in the Exit Codes field.</li> <li>Success Output Contains Command is considered completed successfully if its output contains the text specified in the Scan Output For field.</li> <li>Failure Output Contains Command is considered failed if its output contains the text specified in the Scan Output For field.</li> <li>Step Conditions (z/OS only) Command is considered completed successfully/failed if any of its specified condition codes falls within the range specified under the Step Conditions tab (see Creating Step Conditions).</li> </ul>
Output Type	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output.  Options:  Standard Output (STDOUT) Standard Error (STDERR) File
Exit Codes	Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.
Scan Output For	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this field as a regular expression.
Output File (for Exit Code Processing)	Required if Output Type = File; path and file name of the output file that should be scanned for the text in the Scan Output For field.

Automatic Output Retrieval	Specifies whether you want the Controller to automatically retrieve any output from the job and attach it to the task instance record.
	Options:
	<ul> <li>None Do not attach any output to the task instance record.</li> <li>Standard Output Attach all standard output.</li> <li>Standard Error Attach standard error output.</li> <li>File Attach the file specified in the Output File field.</li> <li>Standard Output/Error Attach all standard output and standard error output.</li> </ul>
	Note Tasks specifying Automatic Output Retrieval will fail with Start Failure if the Agent Output Prohibited field is true in the Details of the specified Agent.
Start Line	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Instructs the Controller to retrieve data beginning at the line indicated.
	<ul> <li>If a Start Line value is not specified, the default is 1.</li> <li>If the Start Line value is -1, data will be retrieved starting at the end of the file.</li> </ul>
Number of Lines	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Allows you to limit the retrieved data to the number of lines specified. If a Number of Lines value is not specified, the default is the value of the Retrieve Output Default Number Of Lines Universal Controller system property.
Scan Text	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Regex pattern that the Controller will search for a match for in STDOUT/STDERR or a specified file. The Controller will include the <b>Number of Lines</b> above and below the first line matched.
	if the Regex pattern is not found, the following message is returned: OPSWISE WARNING - Scan text string not found.
Output File (for Automatic Output Retrieval)	Required if Automatic Output Retrieval = File; path and file name containing the output that you want automatically retrieved and attached to the task instance.
Retry Options	This section contains specifications for retrying the task.
Retry Exit Codes	Exit code range for which an auto-retry of tasks in FAILED status will occur. Exit code ranges must be in the same format as ranges specified in the Exit Codes field. Maximum Retries must be greater than 0.
	If this field is empty, any exit code potentially will cause a retry.

Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval (Seconds)	User-defined; number of seconds between each retry.
Current Retry Count	System-supplied; current number of times that the Controller has retried the task after it first went to failure status.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:  • All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.
	<ul> <li>Workflow conditional path processing; any Successors waiting on a failure path will not be released.</li> </ul>
	• Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which <b>Suppress Intermediate Failures</b> has been enabled.
	Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
Next Retry Time	System-supplied for a task instance in the Failed status that is scheduled for automatic retry; Next time that a retry will be made. If a task instance is not scheduled for automatic retry, Next Retry Time does not display in the task instance Details.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:  • - None - • Time • Relative Time
	<ul> <li>Relative Time</li> <li>Duration</li> <li>Seconds</li> </ul>
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	<ul> <li> None</li> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> </ul>
	Same Day     Do not advance day.
	Next Day
	Advance to the next day.  • Next Business Day
	Advance to the next business day.
	Sunday     If today is not Sunday, advance to next Sunday.
	Monday     If today is not Monday, advance to next Monday.
	<ul> <li>Tuesday</li> </ul>
	If today is not Tuesday, advance to next Tuesday.  • Wednesday
	If today is not Wednesday, advance to next Wednesday.
	Thursday     If today is not Thursday, advance to next Thursday.
	• Friday
	If today is not Friday, advance to next Friday.  • Saturday
	If today is not Saturday, advance to next Saturday.
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.
Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.
	Options are:
	• - None -
	• Duration
	• Seconds

Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Time Options	This section contains time-related specifications for the task instance.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

Late Start Day	
Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
	Valid values:
	None     Advance to the next day if the specified late start time is before the Created time of the task instance.      Same Day     Do not advance day.      Next Day     Advance to the next day.      Next Business Day     Advance to the next business day.      Sunday     If today is not Sunday, advance to next Sunday.      Monday     If today is not Monday, advance to next Monday.      Tuesday     If today is not Tuesday, advance to next Tuesday.      Wednesday     If today is not Wednesday, advance to next Wednesday.      Thursday     If today is not Thursday, advance to next Hursday.      Thursday     If today is not Thursday, advance to next Thursday.      Thursday     If today is not Friday, advance to next Friday.      Saturday     If today is not Saturday, advance to next Saturday.      Nth Day
	Advance to a specific number of days in the future.
	Default is – None
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.
	For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.
	For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None Advance to the next day if the specified late finish time is before the Created time of the task instance. • Same Day Do not advance day. • Next Day Advance to the next day. • Next Business Day Advance to the next business day. • Sunday If today is not Sunday, advance to next Sunday. • Monday If today is not Monday, advance to next Monday. • Tuesday If today is not Tuesday, advance to next Tuesday. • Wednesday If today is not Wednesday, advance to next Wednesday. • Thursday If today is not Wednesday, advance to next Thursday. • Friday If today is not Friday, advance to next Friday. • Friday If today is not Friday, advance to next Friday. • Saturday If today is not Saturday, advance to next Saturday. • Nith Day Advance to a specific number of days in the future.  Default is – None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.										
	Valid values:										
	<ul> <li> None Advance to the next day if the specified early finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul>										
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.										
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.										
Critical Path Options	This section contains Critical Path-related specifications for the task.										
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.										
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.										

CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.
	Options:
	<ul><li>Seconds</li><li>Minutes</li><li>Hours</li></ul>
	Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.
Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.
	Options are:
	<ul> <li> None No restriction for this task.</li> <li>Run Restriction for when this task will be run.</li> <li>Skip Restriction for when this task will be skipped.</li> <li>Hold Restriction for when this task will be held.</li> </ul>
	If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.
Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.
	Options are:
	• - None -
	No period of restriction for this task.  • Before
	Restriction is valid if the date is before the Before Date value.  • After
	Restriction is valid if the date is after the After Date value.  • Span
	Restriction is valid if the date is before the Before Date value and after After Date value.  On Restriction is valid if the date is one of the Date List values.
	Restriction is valid if the date is one of the Date List values.
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.

If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
If Restriction Period = After or Span; Date after which the restriction is valid.
If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
If Restriction Period = On; Date(s) on which the restriction is valid.
This section contains time-related statistics for the task instance.
System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.
Saves updates to the record.
See Force Finishing a Task.
Places the task instance on Hold (see Putting a Task on Hold).
For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.

Re-run	See Re-running a Task.							
View Parent	Displays the task instance Details for the parent Workflow of this task instance.							
Retrieve Output	See Retrieving Output.							
Delete	Deletes the current record.							
Refresh	Refreshes any dynamic data displayed in the Details.							
Close	For pop-up view only; closes the pop-up view of this task instance.							
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.							
Virtual Resources	Lists all Virtual Resources to which this task is assigned.							
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.							
Output	Displays output generated from the process, if any, based on specifications provided by the user in the Automatic Output Retrieval fields in the task Details.  If automatic output retrieval was not available or was not selected, output can be obtained by clicking the Retrieve Output button.							
Notes	Lists all notes associated with this record.							

### **Additional Task and Task Instance Details**

For information on how to access additional details - such as Metadata and complete database Details - for Universal Tasks and Universal Task Instances (or any type of record), see Records.

## **Running a Universal Task**

You can run a Universal Task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the Universal Tasks list or Universal Task Details Action menu.
- As part of a Workflow.
- Specify triggers that run the task automatically based on times or events.

## **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

# **Creating Tasks**

- Tasks
  - Task Types
  - Built-In Variables
- Creating a Task
- All Tasks List
  - All Tasks List Information
- <Task Type> Tasks List
  - <Task Type> Tasks List Information
- Task Details
- Task Instance Details

  - Task Instance Status History
- Task and Task Instance Details Fields
- User-Defined Fields
  - URLS in User-Defined Fields
- Updating Tasks
- Deleting Tasks
- Viewing Task Parents
- Additional Information

## **Tasks**

A Universal Controller task executes a process on a machine, either local or remote. The process might be resident on the machine (agent-based process), or the task itself (such as a File Monitor task) might embed the process.

You can launch tasks within Workflows, by way of triggers, or manually.

## **Task Types**

Task Type	Jsage							
Workflow	e a sequence of connected tasks, which could include other workflows.							
Linux/Unix	atform-specific application on a Linux/Unix machine.							
Windows	a platform-specific application on a Windows machine.							
z/OS	Run a platform-specific application on a z/OS machine.							
Universal Command	Run a platform-specific application on a machine where Universal Command is running.							
SAP	Send commands to an SAP system and gather status information and output back from SAP.							

PeopleSoft	Send commands to a PeopleSoft system and gather status information and output back from PeopleSoft.
File Transfer	Execute file transfers on remote machines using FTP, SFTP, and UDM protocols.
Manual	Create a pause in the workflow during which the user must take some action.
Timer	Execute a timer command for a specified period of time or until a specific time.
SQL	Execute one or a series of SQL statements against the database specified in the task.
Stored Procedure	Execute a stored procedure against the database specified in the task.
Email	Create and send emails.
Email Monitor	Monitor a Mailbox Folder for one or more specific statuses.
Task Monitor	Monitor another task or tasks for one or more specific statuses.
File Monitor	Monitor a specific remote machine for the creation, deletion, change, existence, or non-existence of one or more files at a specific location.
FTP File Monitor	Monitor for a file on a remote machine where an FTP server is running.
System Monitor	Monitor a specific remote machine and check for free disk space.
Variable Monitor	Monitor the value of a Global variable.
Application Control	Execute a start, stop, or query command against an application in the Controller network.
Web Service	Invokes a Web Service running on any application server.
Universal	Execute a user-defined script in a Universal Template on which the task is based.

#### **Built-In Variables**

Several built-in variables are available for use in all task types; other built-in variables exist for specific task types.

## **Creating a Task**

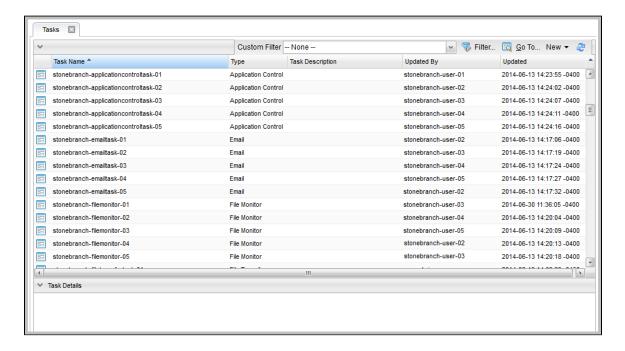

There are multiple ways to create a task:

- 1. On the All Tasks list, click the New drop-down list and select a task type. A Task Details pop-up displays that lets you enter / select information for a new task.
- 2. On the Tasks list for a specific task type, click the **New** icon. A Task Details pop-up displays that lets you enter / select information for a new task.
- 3. In the empty (except for default values) Task Details that displays below the task list for a specific task type, enter / select information for a new task. If the Task Details displays information for an existing task, click the **New** button to clear the Task Details and enter / select information for a new task.
- 4. Create a copy of a task by clicking the **Copy** button in the Task Details and renaming the task.

For detailed information on creating a task for a specific task type, click that task type in the Task Types table, above.

## **All Tasks List**

To display a list of all currently defined tasks for all task types, from the Automation Center navigation pane select Tasks > All Tasks. The All Tasks list displays.

#### **All Tasks List Information**

The following table provides a description of the default columns that display on the All Tasks list.

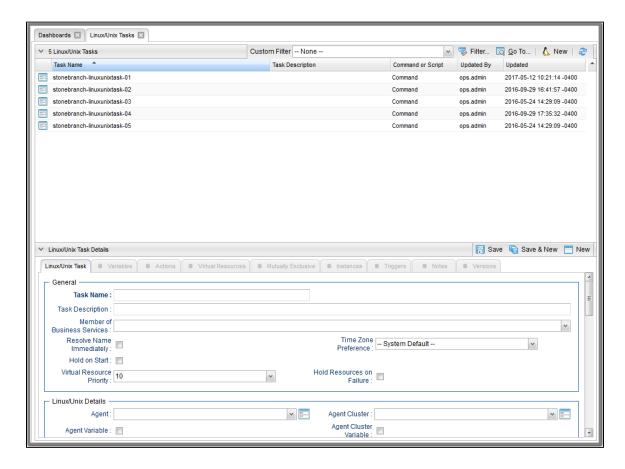

For information about customizing this list, including filtering, sorting, searching, and other list features, see Record Lists.

Column	Description					
Task Name	User-defined. Name assigned to this task.					
Туре	Type of task.					
Task Description	User-defined. Copied from the Task Description field in the task.					
Updated By	System-supplied; User that last updated this record.					
Updated	System-supplied; Date and time this record was last updated.					

## <Task Type> Tasks List

If you select Tasks > <Task Type> from the Automation Center navigation pane, a tasks list for that selected task type displays.

For example:

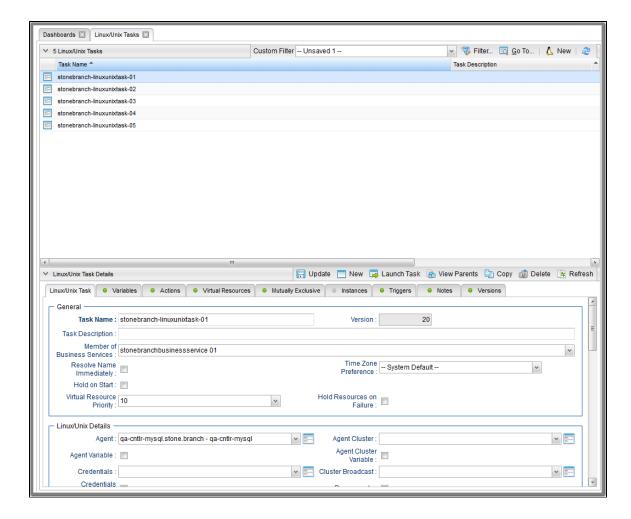

## <Task Type> Tasks List Information

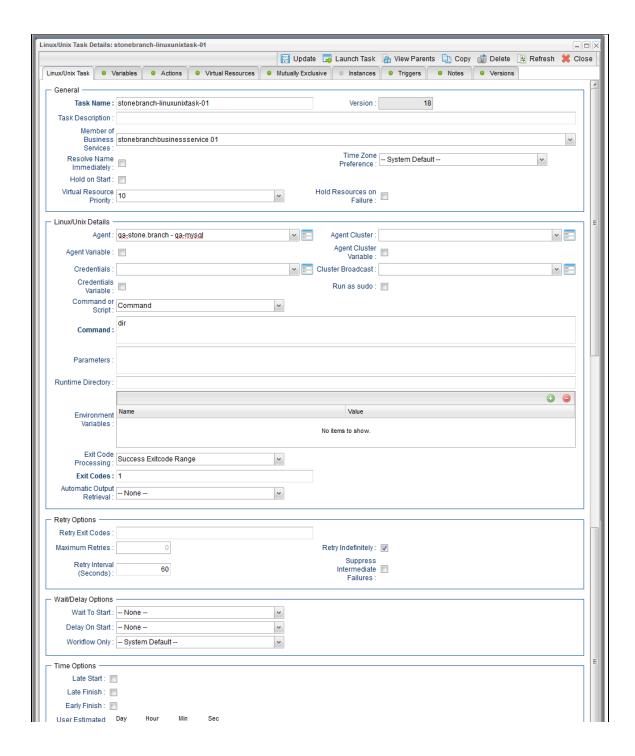

The default columns that display on a <Task Type> Tasks list are specific to that type of task.

## **Task Details**

When you click a task in a Tasks List, Task Details below the list displays all currently defined information for that task.

Use the scroll bar on the right to view more of the Details, or click the Details icon next to the Task Name of the task to display a pop-up version of the task Details.

For more information on viewing Details of any record type, including tasks, see Records.

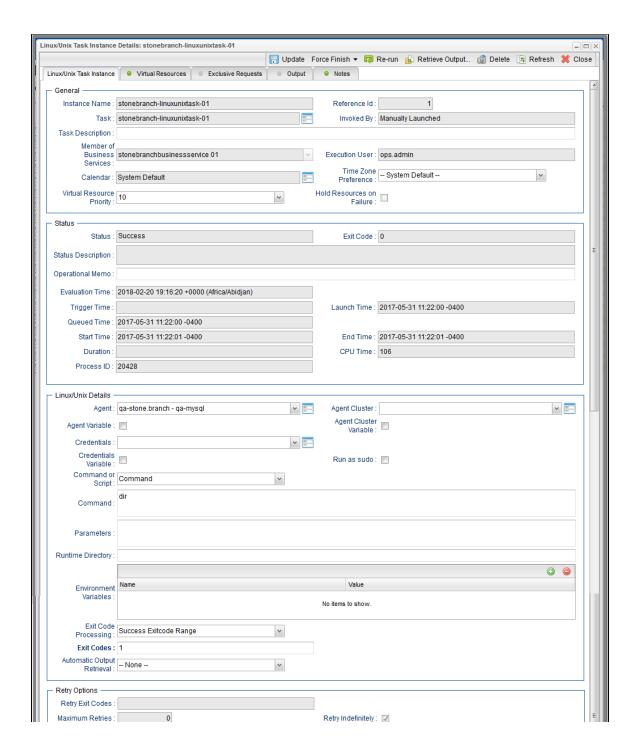

For information on Details for a specific task type, click the appropriate link in Task Types, above.

## **Task Instance Details**

When you run a task, the Controller create a task instance of that task.

You can view task instance details either by:

- From the Task Details, click the Instances tab and select a task instance of that task.
- Select a task instance from the Activity Monitor.
- Select a task instance from the Task Instances list.

### **Additional Task and Task Instance Details**

For information on how to access additional details - such as Metadata and complete database Details - for Tasks and Task Instances (or any type of record), see Records.

## **Task Instance Status History**

The Status History of every task instance is contained in the Metadata and database Details. You also can select to display Status History for every task instance on the Activity Monitor, Task Instances list, and the History list.

## **Task and Task Instance Details Fields**

The following table identifies all fields that appear in task and/or task instance Details of one or more task type(s).

Unless otherwise indicated, each field appears in the Details for both tasks and task instances.

Each field name is a link to a description of that field.

#### Note

Links within these field descriptions are active only when viewing the field descriptions table for a specific task type.

### **User-Defined Fields**

You can define two fields that will display in the General Information section of the task Details for every existing and new task and task instance.

To define a user-defined field:

- 1. Enter a value in either of the following Universal Controller system properties:
  - User Defined Task Field Label 1
  - User Defined Task Field Label 2
- 2. Re-login or click your browser refresh button to see the field(s) in every task Details. In either case, all unsaved changes will be lost, including any open application tabs.

#### Note

The Custom Field 1 and Custom Field 2 built-in variables resolve to the current values of these user-defined fields.

### **URLS in User-Defined Fields**

You can enter a URL in a user-defined field in any task Details. Format: http://, https://, and ftp:// are supported. For example: https://www.stonebranch.com.

An icon, which links to the URL resource, will automatically display next to the field. If you select that user-defined field as a column in the tasks list for that task type, the URL displays as a link in that column for that task. When you click the field icon or the URL link in the column, the URL resource will open in a new browser tab.

# **Updating Tasks**

To save information that you have changed in a task, you must click the **Update** button that displays above and below the Task Details.

If the task is contained in one or more Workflows, and the Confirm Update For Tasks In Workflows Universal Controller system property value is set to **true**, the Confirm Update dialog displays when you click **Update**.

The Confirm Update dialog allows you to see which Workflows could be impacted by the update.

It displays, by default, two columns of information:

You also can display the following additional column by right-clicking either column header and selecting it from Columns on the Action menu:

Vertex Id ID of the task vertex within the Workflow.

Click the **OK** button to update the task, or click the **Cancel** button.

#### Note

You also can see this parent Workflows information for a task without updating a task (see Viewing Task Parents).

For information on updating multiple tasks, see Updating Multiple Records.

# **Deleting Tasks**

To delete a task, either:

- Right-click the task in a tasks list and, on the displayed Action menu, click **Delete**.
- Open the task and click the **Delete** button.

#### Note

You cannot delete a task if it is either:

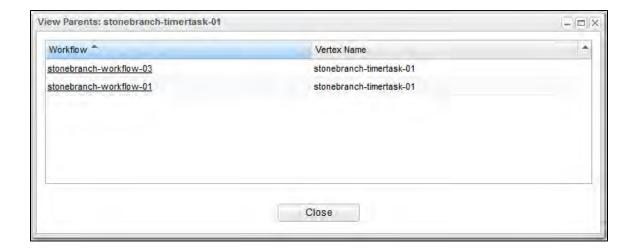

- Specified in an enabled Trigger.
- The only task specified in a disabled Trigger.

# **Viewing Task Parents**

You can view any parent Workflow information for a task either by:

- Clicking the View Parents button in the Task Details
- Displaying the Action menu from the Task Details or Tasks list and then selecting View Parents.

In either case, a View Parents dialog displays:

The View Parents dialog displays, by default, two columns of information:

Workflow	Name of a Workflow that contain the task.
Vertex Name	Name of the task (or task alias) within the Workflow.

You also can display the following additional column by right-clicking either column header and selecting it from Columns on the Action menu:

**Vertex Id** ID of the task vertex within the Workflow.

It also is possible to see this parent Workflows information for a task when you are updating a task.

### **Additional Information**

The following pages provide additional information related to the creation of tasks:

- Creating Task ActionsCopying Tasks
- Setting Mutually Exclusive TasksCreating Notes

### **Linux Unix Task**

- Before You Begin
- Built-In Variables
- Creating a Linux/Unix Task
  - Linux/Unix Task Details
  - Linux/Unix Task Details Field Descriptions
- Viewing a Linux/Unix Task Instance
  - Linux/Unix Task Instance Details
  - Linux/Unix Task Instance Details Field Descriptions
- · Running a Linux/Unix Task
- Monitoring Task Execution

### **Before You Begin**

The Linux/Unix task allows you to run a platform-specific application on a Linux/Unix machine. To run a Linux/Unix task, you must first complete the following tasks:

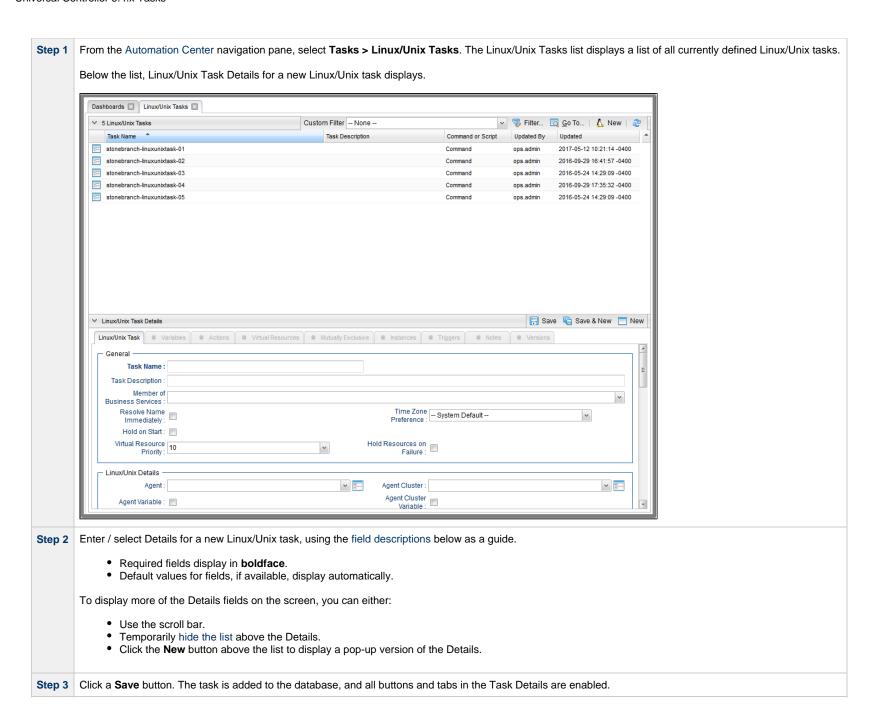

- Install Universal Agent for Linux/Unix on a Linux/Unix machine.
- · Launch the Agent. When the Agent connects with the Controller, it automatically creates an Agent resource definition in the database.
- · Optionally, customize the Agent heartbeat and log levels, as described in Linux/Unix Agent Details Field Descriptions.

### **Built-In Variables**

The following built-in variables can be used in a Linux/Unix task to pass data where appropriate:

- Agent-Based Task Instance variables
- Task Instance variables

## **Creating a Linux/Unix Task**

#### Note

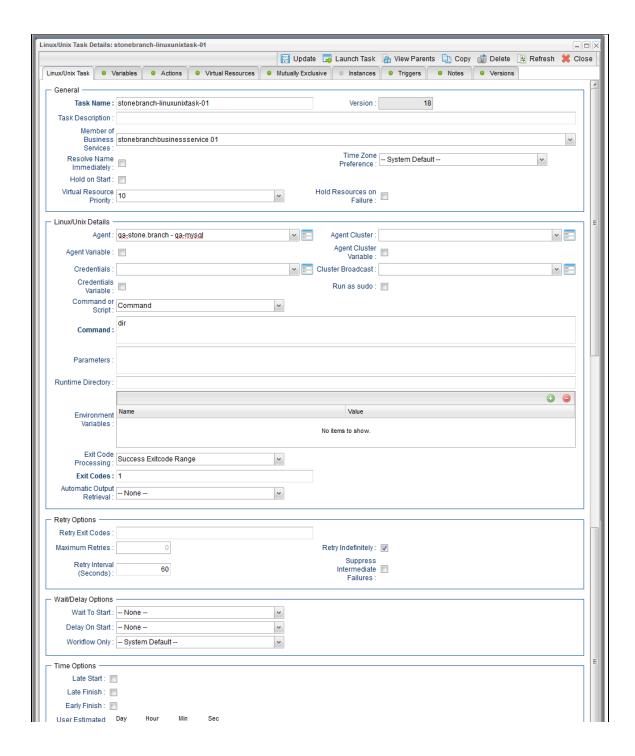

To open an existing record on the list, either:

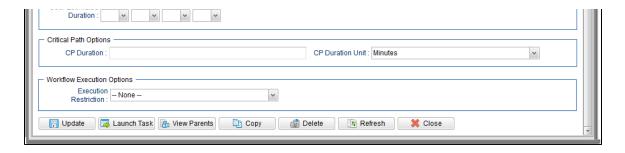

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click Open In Tab in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

### Linux/Unix Task Details

The following Linux/Unix Task Details is for an existing Linux/Unix task.

Depending on the values that you enter / select for these fields, and whether or not the Linux/Unix task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the Linux/Unix Task Details.

### **Linux/Unix Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the Linux/Unix Task Details.

Field Name	Description
General	This section contains general information about the task.
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.

Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default - Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.
Hold Reason	Information about why the task will be put on hold when it starts.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Linux/Unix Details	This section contains assorted detailed information about the task.
Agent	Name of the Agent resource that identifies the machine where the operation will run. If you do not specify an Agent, you must specify an Agent Cluster.
Agent Cluster	Group of Agents, one of which the Controller will choose to run this task (compare with Cluster Broadcast). You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.

#### Agent Variable

Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the **Agent Variable** field to **Yes** and specify the Agent variable in the **Agent Unresolved** field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the **Agent Variable** field to **No** and specify the Agent reference in the **Agent** field.

#### Agent Cluster Variable

Indication of whether the Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using an Agent Cluster reference to using an Agent Cluster variable, you must change the **Agent Cluster Variable** field to **Yes** and specify the Agent Cluster variable in the **Agent Cluster Unresolved** field. Conversely, to change from using an Agent Cluster variable to using an Agent Cluster reference, you must change the **Agent Cluster Variable** field to **No** and specify the Agent Cluster reference in the **Agent Cluster** field.

#### Credentials

Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.

If the user does not have a login shell, add a - character in front of the runtime credentials name. The Controller will provide a shell for that user and strip the - character from the name.

Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

#### Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials**Variable field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

#### Cluster Broadcast

Group of Agents, all of which will run this task (compare with Agent Cluster). You can specify a Cluster Broadcast in place of a specific Agent and/or agent cluster. Each instance of the task running on its own Agent becomes a separate task instance record in the database and displays separately on the Activity Monitor.

Run as sudo	If Command or Script = Command; Run the command as sudo (superuser do).
	The Run as sudo option prefixes the command with either:
	<ul> <li>sudo (if a credential is not specified; that is, the command is run as root)</li> <li>sudo –u userid (if a credential is specified, where userid = the Runtime User from the supplied credential)</li> </ul>
	When using the Run as sudo option, you must grant Universal Broker userid authority to sudo to the requested userid without specifying its password; you can do this via the sudoers file. Please refer to your local security policy and documentation for updating the sudoers file.
Command or Script	Specifies whether a single command or a script is being executed.
	Options:
	<ul><li>Command (default)</li><li>Script</li></ul>
	If the Windows/Linux Scripts Permitted Universal Controller system property is set to false:
	<ul> <li>The Command or Script field is set to Command and is read-only.</li> <li>If the Command or Script field is set to Script, the field becomes modifiable so that you can change it to Command.</li> </ul>
Script	Required if Command or Script = Script; Name of the script in the Controller database that will be executed by this task.
	Note If you click the Details icon for a Script selected in this field, the Script Type field in the Details is read-only.
Command	Required if Command or Script = Command; Command being executed on the remote machine. Variables supported.
Parameters	Any arguments needed by the program to execute properly. Variables supported.
Runtime Directory	Directory from which the application should be executed. Variables supported.
Environment Variables	Allows you to enter environment variables needed by the program to run.
	To add a variable, click the + icon and enter a Name and Value. To delete a variable, select in the list of variables and click the - icon.
	You can add a maximum of 4,000 characters for the combined Names and Values of all variables. The variable is listed in the space underneath.

Specifies how the Controller should determine whether the executed command failed or completed successfully.
Options:
<ul> <li>Success Exitcode Range Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field.</li> <li>Failure Exitcode Range Command is considered failed if its exit code falls within the range specified in the Exit Codes field.</li> <li>Success Output Contains Command is considered completed successfully if its output contains the text specified in the Scan Output For field.</li> <li>Failure Output Contains Command is considered failed if its output contains the text specified in the Scan Output For field.</li> <li>Step Conditions (z/OS only) Command is considered completed successfully/failed if any of its specified condition codes falls within the range specified under the Step Conditions tab (see Creating Step Conditions).</li> </ul>
Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output.  Options:  Standard Output (STDOUT) Standard Error (STDERR) File
Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this field as a regular expression.
Required if Output Type = File; path and file name of the output file that should be scanned for the text in the Scan Output For field.
Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.

Automatic Output	
Retrieval	Specifies whether you want the Controller to automatically retrieve any output from the job and attach it to the task instance record.
	Options:
	<ul> <li>None     Do not attach any output to the task instance record.</li> <li>Standard Output     Attach all standard output.</li> <li>Standard Error     Attach standard error output.</li> <li>File     Attach the file specified in the Output File field.</li> <li>Standard Output/Error     Attach all standard output and standard error output.</li> </ul>
	Note Tasks specifying Automatic Output Retrieval will fail with Start Failure if the Agent Output Prohibited field is true in the Details of the specified Agent.
Start Line	
	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Instructs the Controller to retrieve data beginning at the line indicated.  If a Start Line value is not specified, the default is 1.  If the Start Line value is -1, data will be retrieved starting at the end of the file.
Number of Lines	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Allows you to limit the retrieved data to the number of lines specified. If a Number of Lines value is not specified, the default is the value of the Retrieve Output Default Number Of Lines Universal Controller system property.
Scan Text	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Regex pattern that the Controller will search for a match for in STDOUT/STDERR or a specified file. The Controller will include the <b>Number of Lines</b> above and below the first line matched.  if the Regex pattern is not found, the following message is returned: OPSWISE WARNING - Scan text string not found.
Output File (for Automatic Output Retrieval)	Required if Automatic Output Retrieval = File; path and file name containing the output that you want automatically retrieved and attached to the task instance.
Retry Options	This section contains specifications for retrying the task.
Retry Exit Codes	Exit code range for which an auto-retry of tasks in FAILED status will occur. Exit code ranges must be in the same format as ranges specified in the Exit Codes field. Maximum Retries must be greater than 0.
	If this field is empty, any exit code potentially will cause a retry.

Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval (Seconds)	User-defined; number of seconds between each retry.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:  • All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.  • Workflow conditional path processing; any Successors waiting on a failure path will not be released.  • Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which Suppress Intermediate Failures has been enabled.  • Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.  Options are:  - None -  Time Relative Time Duration Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	<ul> <li> None</li> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> </ul>
	<ul> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> </ul>
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.
Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.
	Options are:
	<ul> <li>None –</li> <li>Duration</li> <li>Seconds</li> </ul>

Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  Options are:  System Default Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.) - Yes Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow No Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

Late Start Day	
Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
	Valid values:
	None     Advance to the next day if the specified late start time is before the Created time of the task instance.      Same Day     Do not advance day.      Next Day     Advance to the next day.      Next Business Day     Advance to the next business day.      Sunday     If today is not Sunday, advance to next Sunday.      Monday     If today is not Monday, advance to next Monday.      Tuesday     If today is not Tuesday, advance to next Tuesday.      Wednesday     If today is not Wednesday, advance to next Wednesday.      Thursday     If today is not Thursday, advance to next Hursday.      Thursday     If today is not Thursday, advance to next Thursday.      Thursday     If today is not Friday, advance to next Friday.      Saturday     If today is not Saturday, advance to next Saturday.      Nth Day
	Advance to a specific number of days in the future.
	Default is – None
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.
	For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.
	For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Late Finish Type	Required if Late Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.
	Valid values:
	<ul> <li> None Advance to the next day if the specified late finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day</li> </ul>
	Advance to the next day.  Next Business Day Advance to the next business day. Sunday
	If today is not Sunday, advance to next Sunday.  • Monday If today is not Monday, advance to next Monday.  • Tuesday  —
	<ul> <li>If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday</li> <li>If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday</li> </ul>
	If today is not Thursday, advance to next Thursday.  • Friday  If today is not Friday, advance to next Friday.
	<ul> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul>
	Default is – None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.
Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.

Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  • "None Advance to the next day if the specified early finish time is before the Created time of the task instance.  • Same Day Do not advance day. • Next Day Advance to the next day.  • Next Business Day Advance to the next business day.  • Sunday If today is not Sunday, advance to next Sunday.  • Monday If today is not Monday, advance to next Monday.  • Tuesday If today is not Tuesday, advance to next Tuesday.  • Wednesday If today is not Wednesday, advance to next Wednesday.  • Thursday If today is not Thursday, advance to next Thursday.  • Finday If today is not Thursday, advance to next Thursday.  • Finday If today is not Staturday, advance to next Friday.  • Saturday If today is not Saturday, advance to next Saturday.  • Nith Day Advance to a specific number of days in the future.  Default is – None

Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds Minutes Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.

Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.  Options are:  - None No restriction for this task Run Restriction for when this task will be run Skip Restriction for when this task will be skipped Hold Restriction for when this task will be held.  If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.
Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.  Options are:  • - None - No period of restriction for this task.  • Before Restriction is valid if the date is before the Before Date value.  • After Restriction is valid if the date is after the After Date value.  • Span Restriction is valid if the date is before the Before Date value and after After Date value.  • On Restriction is valid if the date is one of the Date List values.
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for task instances of the task.

First Time Ran	System-supplied; date and time this task first ran.
Last Time Ran	System-supplied; date and time the task last ran.
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.
Lowest Instance Time	System-supplied; shortest amount of time this task has taken to run.
Average Instance Time	System-supplied; average amount of time this task takes to run.
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.
Number of Instances	System-supplied; number of instances in the database for this task.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Buttons	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Save	Saves a new task record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new task.
Update	Saves updates to the record.
Launch Task	Manually launches the task.

View Parents	Displays a list of any parent Workflow tasks for this task.	
Сору	Creates a copy of this task, which you are prompted to rename.	
Delete	Deletes the current record.	
	<ul> <li>Note         You cannot delete a task if it is either:         <ul> <li>Specified in an enabled Trigger.</li> <li>The only task specified in a disabled Trigger.</li> </ul> </li> </ul>	
Refresh	Refreshes any dynamic data displayed in the Details.	
Close	For pop-up view only; closes the pop-up view of this task.	
Tabs	This section identifies the tabs across the top of the Task Details that provide access to additional information about the task.	
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.	

Actions		
	, ,	cify actions that the Controller will take automatically based on events that occur during the execution of this task.
	Events are:	
	Task insta     Exit code	S
	<ul><li>Late start</li><li>Late finish</li></ul>	h
	Early finis	sh
	Actions are:	
	Abort Action	Abort the task if certain events occur. For details, see Abort Actions.
	Email Notification	Send an email if certain events occur. For details, see Email Notification Actions.
	Set Variable	Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow.
	SNMP Notification	Send an email if certain events occur. For details, see SNMP Notification Actions.
	System Operation	Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions.
Virtual Resources	Lists all Virtual Re	esources to which this task is assigned.
Mutually Exclusive	Lists all tasks that	have been set to be mutually exclusive of this task.
Instances	Lists all instances	of the task.
Triggers	add new triggers.	that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current name="" task="">#TRIGGER#. he default name if desired. For instructions on creating triggers, see Triggers.</current>
Notes	Lists all notes ass	ociated with this record.
Versions	Stores copies of a	all previous versions of the current record. See Record Versioning.

# Viewing a Linux/Unix Task Instance

When a Linux/Unix task is launched, the Controller creates a task instance record of that task.

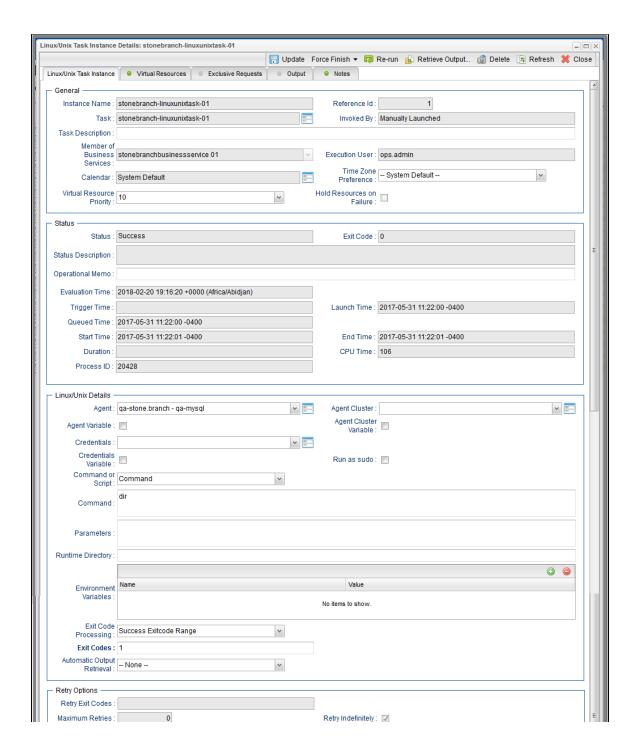

A task instance contains detailed information about a single execution of that task.

You can access a task instance from:

- Instances tab on the Linux/Unix Task Details for that task
- Activity Monitor
- Task Instances list

### **Linux/Unix Task Instance Details**

The following Linux/Unix Task Instance Details contains information on the execution of the task shown in the Linux/Unix Task Details.

### **Linux/Unix Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in Linux/Unix Task Instance Details.

Field Name	Description
General	This section contains general information about the task instance.
Instance Name	Name of this task instance.
Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.
Invoked by	System-supplied; how the task instance was launched.  Options:  Trigger: (Trigger Name)     Instance was launched by the named trigger.  Workflow: (Workflow Name)     Instance was launched by the named workflow.  Manually Launched     Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.

Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)

Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.
End Time	System-supplied; Date and time the task instance completed.
Duration	System-supplied; amount of time the task instance took to run.
CPU Time	System-supplied; amount of CPU time the task took to run.
Process ID	System-supplied; ID of the process that was launched.
Linux/Unix Details	This section contains assorted detailed information about the task instance.
Agent	Name of the Agent resource that identifies the machine where the operation will run. If you do not specify an Agent, you must specify an Agent Cluster.

#### Agent Variable

Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the **Agent Variable** field to **Yes** and specify the Agent variable in the **Agent Unresolved** field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the **Agent Variable** field to **No** and specify the Agent reference in the **Agent** field.

### Agent Cluster

Group of Agents, one of which the Controller will choose to run this task (compare with Cluster Broadcast). You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.

#### Agent Cluster Variable

Indication of whether the Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using an Agent Cluster reference to using an Agent Cluster variable, you must change the **Agent Cluster Variable** field to **Yes** and specify the Agent Cluster variable in the **Agent Cluster Unresolved** field. Conversely, to change from using an Agent Cluster variable to using an Agent Cluster reference, you must change the **Agent Cluster Variable** field to **No** and specify the Agent Cluster reference in the **Agent Cluster** field.

#### Credentials

Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.

If the user does not have a login shell, add a - character in front of the runtime credentials name. The Controller will provide a shell for that user and strip the - character from the name.

Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

#### Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials**Variable field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

Run as sudo	If Command or Script = Command; Run the command as sudo (superuser do).
	The Run as sudo option prefixes the command with either:
	<ul> <li>sudo (if a credential is not specified; that is, the command is run as root)</li> <li>sudo –u userid (if a credential is specified, where userid = the Runtime User from the supplied credential)</li> </ul>
	When using the Run as sudo option, you must grant Universal Broker userid authority to sudo to the requested userid without specifying its password; you can do this via the sudoers file. Please refer to your local security policy and documentation for updating the sudoers file.
Command or Script	Specifies whether a single command or a script is being executed.
	Options:
	<ul><li>Command (default)</li><li>Script</li></ul>
	If the Windows/Linux Scripts Permitted Universal Controller system property is set to false:
	<ul> <li>The Command or Script field is set to Command and is read-only.</li> <li>If the Command or Script field is set to Script, the field becomes modifiable so that you can change it to Command.</li> </ul>
Script	Required if Command or Script = Script; Name of the script in the Controller database that will be executed by this task.
	Note If you click the Details icon for a Script selected in this field, the Script Type field in the Details is read-only.
Command	Required if Command or Script = Command; Command being executed on the remote machine. Variables supported.
Parameters	Any arguments needed by the program to execute properly. Variables supported.
Runtime Directory	Directory from which the application should be executed. Variables supported.
Environment Variables	Allows you to enter environment variables needed by the program to run.
	To add a variable, click the + icon and enter a Name and Value. To delete a variable, select in the list of variables and click the - icon.
	You can add a maximum of 4,000 characters for the combined Names and Values of all variables. The variable is listed in the space underneath.

Exit Code Processing	Specifies how the Controller should determine whether the executed command failed or completed successfully.
	Options:
	<ul> <li>Success Exitcode Range Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field.</li> <li>Failure Exitcode Range Command is considered failed if its exit code falls within the range specified in the Exit Codes field.</li> <li>Success Output Contains Command is considered completed successfully if its output contains the text specified in the Scan Output For field.</li> <li>Failure Output Contains Command is considered failed if its output contains the text specified in the Scan Output For field.</li> <li>Step Conditions (z/OS only) Command is considered completed successfully/failed if any of its specified condition codes falls within the range specified under the Step Conditions tab (see Creating Step Conditions).</li> </ul>
Output Type	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output.  Options:  Standard Output (STDOUT) Standard Error (STDERR) File
Exit Codes	Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.
Scan Output For	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this field as a regular expression.
Output File (for Exit Code Processing)	Required if Output Type = File; path and file name of the output file that should be scanned for the text in the Scan Output For field.

Automatic Output Retrieval	Specifies whether you want the Controller to automatically retrieve any output from the job and attach it to the task instance record.
	Options:
	<ul> <li>None Do not attach any output to the task instance record.</li> <li>Standard Output Attach all standard output.</li> <li>Standard Error Attach standard error output.</li> <li>File Attach the file specified in the Output File field.</li> <li>Standard Output/Error Attach all standard output and standard error output.</li> </ul>
	Note Tasks specifying Automatic Output Retrieval will fail with Start Failure if the Agent Output Prohibited field is true in the Details of the specified Agent.
Start Line	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Instructs the Controller to retrieve data beginning at the line indicated.
	<ul> <li>If a Start Line value is not specified, the default is 1.</li> <li>If the Start Line value is -1, data will be retrieved starting at the end of the file.</li> </ul>
Number of Lines	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Allows you to limit the retrieved data to the number of lines specified. If a Number of Lines value is not specified, the default is the value of the Retrieve Output Default Number Of Lines Universal Controller system property.
Scan Text	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Regex pattern that the Controller will search for a match for in STDOUT/STDERR or a specified file. The Controller will include the <b>Number of Lines</b> above and below the first line matched.
	if the Regex pattern is not found, the following message is returned: OPSWISE WARNING - Scan text string not found.
Output File (for Automatic Output Retrieval)	Required if Automatic Output Retrieval = File; path and file name containing the output that you want automatically retrieved and attached to the task instance.
Retry Options	This section contains specifications for retrying the task.
Retry Exit Codes	Exit code range for which an auto-retry of tasks in FAILED status will occur. Exit code ranges must be in the same format as ranges specified in the Exit Codes field. Maximum Retries must be greater than 0.
	If this field is empty, any exit code potentially will cause a retry.

Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval (Seconds)	User-defined; number of seconds between each retry.
Current Retry Count	System-supplied; current number of times that the Controller has retried the task after it first went to failure status.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:  • All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.
	<ul> <li>Workflow conditional path processing; any Successors waiting on a failure path will not be released.</li> </ul>
	<ul> <li>Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which Suppress Intermediate Failures has been enabled.</li> </ul>
	<ul> <li>Any Workflow containing the Failed task instance will not transition to the Running/Problems status.</li> </ul>
Next Retry Time	System-supplied for a task instance in the Failed status that is scheduled for automatic retry; Next time that a retry will be made. If a task instance is not scheduled for automatic retry, Next Retry Time does not display in the task instance Details.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	<ul> <li>None –</li> <li>Time</li> <li>Relative Time</li> <li>Duration</li> <li>Seconds</li> </ul>
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	- None  • If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.  • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.  • Same Day  Do not advance day.  • Next Day  Advance to the next day.  • Next Business Day  Advance to the next business day.  • Sunday  If today is not Sunday, advance to next Sunday.  • Monday  If today is not Monday, advance to next Monday.  • Tuesday  If today is not Tuesday, advance to next Wednesday.  • Thursday  If today is not Thursday, advance to next Thursday.  • Friday  If today is not Thursday, advance to next Friday.  • Saturday  If today is not Friday, advance to next Friday.  • Saturday  If today is not Saturday, advance to next Saturday.  Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.
Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.  Options are:  • None –  • Duration • Seconds

Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Time Options	This section contains time-related specifications for the task instance.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
Constraint	Valid values:
	Valid values:  • None Advance to the next day if the specified late start time is before the Created time of the task instance.  • Same Day Do not advance day.  • Next Day Advance to the next day.  • Next Business Day Advance to the next business day.  • Sunday If today is not Sunday, advance to next Sunday.  • Monday If today is not Monday, advance to next Monday.  • Tuesday If today is not Tuesday, advance to next Tuesday.  • Wednesday If today is not Tuesday, advance to next Wednesday.  • Thursday If today is not Tuesday, advance to next Tuesday.  • Thursday If today is not Thursday, advance to next Thursday.  • Friday If today is not Friday, advance to next Friday.  • Saturday If today is not Saturday, advance to next Saturday.  • Nth Day Advance to a specific number of days in the future.
	Default is – None
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.  For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.  For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.			
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.			
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.			
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None Advance to the next day if the specified late finish time is before the Created time of the task instance.  • Same Day Do not advance day.  • Next Day Advance to the next day.  • Next Day Advance to the next day.  • Next Business Day Advance to the next business day.  • Sunday If today is not Sunday, advance to next Sunday.  • Monday If today is not Monday, advance to next Monday.  • Tuesday If today is not Tuesday, advance to next Tuesday.  • Wednesday If today is not Thursday, advance to next Wednesday.  • Thursday If today is not Thursday, advance to next Thursday.  • Friday If today is not Friday, advance to next Friday.  • Saturday If today is not Saturday, advance to next Saturday.  • Nth Day Advance to a specific number of days in the future.  Default is - None			
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.			

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.
	Valid values:
	• None
	Advance to the next day if the specified early finish time is before the Created time of the task instance.
	• Same Day Do not advance day.
	Next Day     Advance to the next day.
	Next Business Day
	Advance to the next business day.  • Sunday
	If today is not Sunday, advance to next Sunday.
	Monday     If today is not Monday, advance to next Monday.
	Tuesday
	If today is not Tuesday, advance to next Tuesday.  • Wednesday
	If today is not Wednesday, advance to next Wednesday.  • Thursday
	If today is not Thursday, advance to next Thursday.
	Friday     If today is not Friday, advance to next Friday.
	Saturday
	If today is not Saturday, advance to next Saturday.  • Nth Day
	Advance to a specific number of days in the future.
	Default is – None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most
	cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.

CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.
	Options:
	<ul><li>Seconds</li><li>Minutes</li><li>Hours</li></ul>
	Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.
Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.
	Options are:
	<ul> <li> None No restriction for this task.</li> <li>Run Restriction for when this task will be run.</li> <li>Skip Restriction for when this task will be skipped.</li> <li>Hold Restriction for when this task will be held.</li> </ul>
	If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.
Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.
	Options are:
	• - None -
	No period of restriction for this task.  • Before
	Restriction is valid if the date is before the Before Date value.  • After
	Restriction is valid if the date is after the After Date value.  • Span
	Restriction is valid if the date is before the Before Date value and after After Date value.  • On
	Restriction is valid if the date is one of the Date List values.
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.

Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.			
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.			
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.			
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.			
Statistics	This section contains time-related statistics for the task instance.			
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.			
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.			
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.			
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.			
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.			
Metadata	This section contains Metadata information about this record.			
UUID	Universally Unique Identifier of this record.			
Updated By	Name of the user that last updated this record.			
Updated	Date and time that this record was last updated.			
Created By	Name of the user that created this record.			
Created	Date and time that this record was created.			
Status History	History of all statuses that the task instance has gone through.			
Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.			
Update	Saves updates to the record.			

Force Finish	See Force Finishing a Task.			
Hold	Places the task instance on Hold (see Putting a Task on Hold).			
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.			
Re-run	See Re-running a Task.			
View Parent	Displays the task instance Details for the parent Workflow of this task instance.			
Retrieve Output	See Retrieving Output.			
Delete	Deletes the current record.			
Refresh	Refreshes any dynamic data displayed in the Details.			
Close	For pop-up view only; closes the pop-up view of this task instance.			
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.			
Virtual Resources	Lists all Virtual Resources to which this task is assigned.			
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.			
Output	Displays output generated from the process, if any, based on specifications provided by the user in the Automatic Output Retrieval fields in the task Details.  If automatic output retrieval was not available or was not selected, output can be obtained by clicking the Retrieve Output button.			
Notes	Lists all notes associated with this record.			

# Running a Linux/Unix Task

You can run a Linux/Unix task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the Linux/Unix tasks list or Linux/Unix Task Details Action menu.
- As part of a Workflow.
  Specify triggers that run the task automatically based on times or events.

## **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

### **Windows Task**

- Before You Begin
- Built-In Variables
- · Creating a Windows Task
  - Windows Task Details
  - Windows Task Details Field Descriptions
- Viewing a Windows Task Instance
  - Windows Task Instance Details
  - Windows Task Instance Details Field Descriptions
- · Running a Windows Task
- Monitoring Task Execution

## **Before You Begin**

The Windows task allows you to run a platform-specific application on a Windows machine. To run a Windows task, you must first complete the following tasks:

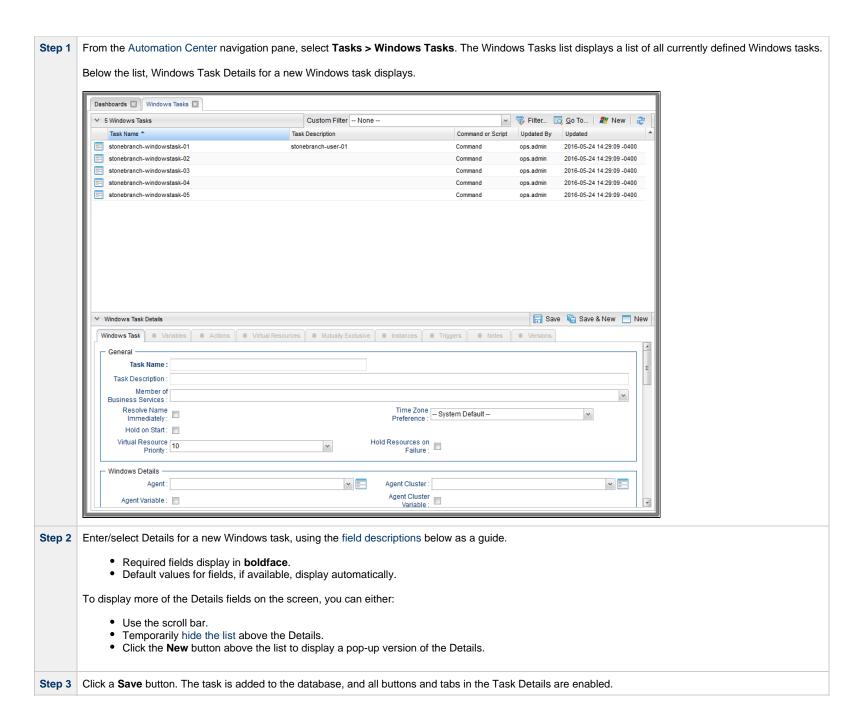

- Install Universal Agent for Windows on a Windows machine.
- · Launch the Agent. When the Agent connects with the Controller, it automatically creates an Agent resource definition in the database.
- · Optionally, customize the Agent heartbeat and log levels, as described in Windows Agent Details Field Descriptions.

### **Built-In Variables**

The following built-in variables can be used in a Windows task to pass data where appropriate:

- Agent-Based Task Instance variables
- Task Instance variables

## **Creating a Windows Task**

#### Note

To open an existing record on the list, either:

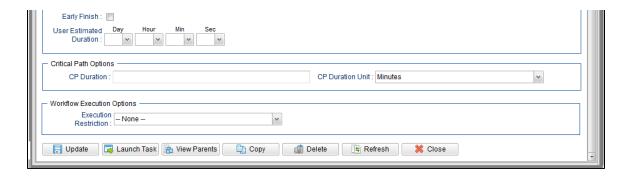

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click **Open In Tab** in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

### **Windows Task Details**

The following Windows Task Details is for an existing Windows task.

Depending on the values that you enter / select for these fields, and whether or not the Windows task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the Windows Task Details.

## **Windows Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the Windows Task Details.

Field Name	Description			
General	This section contains general information about the task.			
Task Name	ser-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme tasks.			
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.			
Task Description	Description of this record. (Maximum = 200 characters.)			
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.			
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.			

Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default –			
	<ul> <li>Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.</li> <li>Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.</li> </ul>			
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.			
Hold Reason	Information about why the task will be put on hold when it starts.			
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.			
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.			
Windows Details	This section contains assorted detailed information about the task.			
Agent	Name of the Agent resource that identifies the machine where the operation will run. If you do not specify an Agent, you must specify an Agent Cluster.			
Agent Cluster	Group of Agents, one of which the Controller will choose to run this task (compare with Cluster Broadcast). You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.			

#### Agent Variable

Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the **Agent Variable** field to **Yes** and specify the Agent variable in the **Agent Unresolved** field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the **Agent Variable** field to **No** and specify the Agent reference in the **Agent** field.

### Agent Cluster Variable

Indication of whether the Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using an Agent Cluster reference to using an Agent Cluster variable, you must change the **Agent Cluster Variable** field to **Yes** and specify the Agent Cluster variable in the **Agent Cluster Unresolved** field. Conversely, to change from using an Agent Cluster variable to using an Agent Cluster reference, you must change the **Agent Cluster Variable** field to **No** and specify the Agent Cluster reference in the **Agent Cluster** field.

#### Credentials

Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.

Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

#### Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials**Variable field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

#### Cluster Broadcast

Group of Agents, all of which will run this task (compare with Agent Cluster). You can specify a Cluster Broadcast in place of a specific Agent and/or agent cluster. Each instance of the task running on its own Agent becomes a separate task instance record in the database and displays separately on the Activity Monitor.

# Run with Highest Privileges

This option must be enabled in order to execute the task using an elevated privileges token, rather than one subject to User Account Control (UAC) restrictions. An elevated token allows a process to execute with all the privileges available to its specified credentials. For example, a task executed with an administrative account will behave as though it received permission via a UAC dialog to perform a privileged operation.

This option will **not** give a user account privileges that have are not already granted to it. For example, taking ownership of a file is a privileged operation by default. A task will still fail even with this option selected if it is run with a regular user account that has not been granted the ability to change file ownership.

#### Note

This option only will affect tasks executed on Windows systems that support User Account Control (UAC). It will have no affect on tasks run on Windows releases prior to Vista (for example, Windows XP, Server 2003).

### Command or Script

Specifies whether a single command or a script is being executed.

#### Options:

- Command (default)
- Script

If the Windows/Linux Scripts Permitted Universal Controller system property is set to false:

- The Command or Script field is set to Command and is read-only.
- If the Command or Script field is set to Script, the field becomes modifiable so that you can change it to Command.

#### Note

For both command-based tasks that call a .vbs/.js file directly, and script-based tasks that also rely on the systems association with file extension, GUI-based wscript.exe is associated with the vbs and js file extensions. Without explicitly calling one or the other, the Controller would use wscript.exe.

The Agent system may need to be adjusted to properly use the Windows Scripting Host from the scheduler/agent environment.

The following command can be used to set the default script host to cscript.exe: C:\tmp>cscript //h:cscript //s

### Command

Required if Command or Script = Command; Command being executed on the remote machine. Variables supported.

### Script

Required if Command or Script = Script; Name of the script in the Controller database that will be executed by this task.

#### Note

If you click the Details icon for a Script selected in this field, the Script Type field in the Details is read-only.

Parameters	Any arguments needed by the program to execute properly. Variables supported.
Runtime Directory	Directory from which the application should be executed. Variables supported.
Interact with Desktop	This option must be enabled for a task that runs an application with a GUI requiring some manual actions from a user (for example, clicking buttons or entering values).
	Note When using this option to display GUI applications on any version of Windows that enforces session 0 desktop isolation (that is, Windows Vista and later), the GUI will only be accessible from the interactive console session. Further, the task will execute using the credentials of the user logged into that session. This means that any GUI-based application executed via a Windows task will not be visible from a remote desktop session. It will be visible only from console of the interactive session that exists on the system itself (that is, the session you would see from a monitor attached directly to the Windows machine or by logging in via a VM's host UI).
Create Console	If Interact with Desktop is enabled; Allocates a new console for the process, rather than having it inherit one.
Environment Variables	Allows you to enter environment variables needed by the program to run.  To add a variable, click the + icon and enter a <b>Name</b> and <b>Value</b> . To delete a variable, select in the list of variables and click the - icon.  You can add a maximum of 4,000 characters for the combined Names and Values of all variables. The variable is listed in the space underneath.
Exit Code Processing	Specifies how the Controller should determine whether the executed command failed or completed successfully.  Options:
	<ul> <li>Success Exitcode Range Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field.</li> <li>Failure Exitcode Range Command is considered failed if its exit code falls within the range specified in the Exit Codes field.</li> <li>Success Output Contains Command is considered completed successfully if its output contains the text specified in the Scan Output For field.</li> <li>Failure Output Contains Command is considered failed if its output contains the text specified in the Scan Output For field.</li> <li>Step Conditions (z/OS only) Command is considered completed successfully/failed if any of its specified condition codes falls within the range specified under the Step Conditions tab (see Creating Step Conditions).</li> </ul>

Output Type	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output.  Options:  Standard Output (STDOUT) Standard Error (STDERR) File
Scan Output For	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this field as a regular expression.
Output File (for Exit Code Processing)	Required if Output Type = File; path and file name of the output file that should be scanned for the text in the Scan Output For field.
Exit Codes	Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.
Automatic Output Retrieval	Specifies whether you want the Controller to automatically retrieve any output from the job and attach it to the task instance record.  Options:  None Do not attach any output to the task instance record. Standard Output Attach all standard output. Standard Error Attach standard error output. File Attach the file specified in the Output File field. Standard Output/Error Attach all standard output and standard error output.
	Note Tasks specifying Automatic Output Retrieval will fail with Start Failure if the Agent Output Prohibited field is true in the Details of the specified Agent.
Start Line	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Instructs the Controller to retrieve data beginning at the line indicated.  • If a <b>Start Line</b> value is not specified, the default is 1.  • If the <b>Start Line</b> value is <b>-1</b> , data will be retrieved starting at the end of the file.

Number of Lines	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Allows you to limit the retrieved data to the number of lines specified. If a Number of Lines value is not specified, the default is the value of the Retrieve Output Default Number Of Lines Universal Controller system property.
Scan Text	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Regex pattern that the Controller will search for a match for in STDOUT/STDERR or a specified file. The Controller will include the <b>Number of Lines</b> above and below the first line matched.  if the Regex pattern is not found, the following message is returned: OPSWISE WARNING - Scan text string not found.
Output File (for Automatic Output Retrieval)	Required if Automatic Output Retrieval = File; path and file name containing the output that you want automatically retrieved and attached to the task instance.
<b>Retry Options</b>	This section contains specifications for retrying the task.
Retry Exit Codes	Exit code range for which an auto-retry of tasks in FAILED status will occur. Exit code ranges must be in the same format as ranges specified in the Exit Codes field.  Maximum Retries must be greater than 0.
Maximum Retries	If this field is empty, any exit code potentially will cause a retry.  User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval (Seconds)	User-defined; number of seconds between each retry.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:
	All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.
	<ul> <li>Workflow conditional path processing; any Successors waiting on a failure path will not be released.</li> </ul>
	• Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which <b>Suppress Intermediate Failures</b> has been enabled.
	<ul> <li>Any Workflow containing the Failed task instance will not transition to the Running/Problems status.</li> </ul>
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.

Wait To Start	Amount of time to wait before starting a task from the time that it was launched
	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	<ul><li>None –</li><li>Time</li></ul>
	<ul><li>Relative Time</li><li>Duration</li></ul>
	Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	<ul> <li> None</li> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all</li> </ul>
	dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.
	<ul> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent</li> </ul>
	workflow task instance.  • Same Day
	Do not advance day.  • Next Day
	Advance to the next day.  • Next Business Day
	Advance to the next business day.  • Sunday
	If today is not Sunday, advance to next Sunday.  • Monday
	If today is not Monday, advance to next Monday.  Tuesday
	If today is not Tuesday, advance to next Tuesday.
	Wednesday     If today is not Wednesday, advance to next Wednesday.
	Thursday     If today is not Thursday, advance to next Thursday.
	Friday     If today is not Friday, advance to next Friday.
	Saturday     If today is not Saturday, advance to next Saturday.
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.

Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.  Options are:  - None -  Duration Seconds
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  Options are:  System Default Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.) - Yes Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow No Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
Constraint	Valid values:
	Valid values:  • None Advance to the next day if the specified late start time is before the Created time of the task instance.  • Same Day Do not advance day.  • Next Day Advance to the next day.  • Next Business Day Advance to the next business day.  • Sunday If today is not Sunday, advance to next Sunday.  • Monday If today is not Monday, advance to next Monday.  • Tuesday If today is not Tuesday, advance to next Tuesday.  • Wednesday If today is not Tuesday, advance to next Wednesday.  • Thursday If today is not Tuesday, advance to next Tuesday.  • Thursday If today is not Thursday, advance to next Thursday.  • Friday If today is not Friday, advance to next Friday.  • Saturday If today is not Saturday, advance to next Saturday.  • Nth Day Advance to a specific number of days in the future.
	Default is – None
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.  For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.  For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None     Advance to the next day if the specified late finish time is before the Created time of the task instance.  • Same Day     Do not advance day.  • Next Dusiness Day     Advance to the next day.  • Next Business Day     Advance to the next business day.  • Sunday     If today is not Sunday, advance to next Sunday.  • Monday     If today is not Tuesday, advance to next Monday.  • Tuesday     If today is not Tuesday, advance to next Tuesday.  • Wednesday     If today is not Thursday, advance to next Wednesday.  • Thursday     If today is not Thursday, advance to next Thursday.  • Friday     If today is not Friday, advance to next Fliday.  • Saturday     If today is not Saturday, advance to next Saturday.  • Nth Day     Advance to a specific number of days in the future.  Default is - None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.
Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.

Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	Valid values:  - None - Advance to the next day if the specified early finish time is before the Created time of the task instance. Same Day Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Wednesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Thursday If today is not Thursday, advance to next Thursday. Thursday If today is not Thursday, advance to next Thursday. Thursday If today is not Thursday, advance to next Friday. Saturday If today is not Saturday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future.  Default is - None

Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds Minutes Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.

Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.  Options are:  None No restriction for this task. Run Restriction for when this task will be run. Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held.  If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.
Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.  Options are:  • - None - No period of restriction for this task. • Before Restriction is valid if the date is before the Before Date value. • After Restriction is valid if the date is after the After Date value. • Span Restriction is valid if the date is before the Before Date value and after After Date value. • On Restriction is valid if the date is one of the Date List values.
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for task instances of the task.

Last Instance Duration	System-supplied; date and time the task last ran.  System-supplied; amount of time the task took to run the last time it ran.  System-supplied; shortest amount of time this task has taken to run.
S	
	System-supplied; shortest amount of time this task has taken to run.
Lowest Instance Time	
Average Instance Time	System-supplied; average amount of time this task takes to run.
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.
Number of Instances	System-supplied; number of instances in the database for this task.
Metadata T	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By N	Name of the user that last updated this record.
Updated D	Date and time that this record was last updated.
Created By N	Name of the user that created this record.
Created D	Date and time that this record was created.
Buttons T	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Save S	Saves a new task record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New D	Displays empty (except for default values) Details for creating a new task.
<b>Update</b> S	Saves updates to the record.
Launch Task	Manually launches the task.

View Parents	Displays a list of any parent Workflow tasks for this task.
Сору	Creates a copy of this task, which you are prompted to rename.
Delete	Deletes the current record.
	<ul> <li>Note         You cannot delete a task if it is either:         <ul> <li>Specified in an enabled Trigger.</li> <li>The only task specified in a disabled Trigger.</li> </ul> </li> </ul>
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task.
Tabs	This section identifies the tabs across the top of the Task Details that provide access to additional information about the task.
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.

Actions	A.U			
	Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task.  Events are:			
	Task insta Exit code Late start Late finish Early finish	s : h		
	Actions are:			
	Abort Action	Abort the task if certain events occur. For details, see Abort Actions.		
	Email Notification	Send an email if certain events occur. For details, see Email Notification Actions.		
	Set Variable	Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow.		
	SNMP Notification	Send an email if certain events occur. For details, see SNMP Notification Actions.		
	System Operation	Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions.		
Virtual Resources	Lists all Virtual Resources to which this task is assigned.			
Mutually Exclusive	Lists all tasks that have been set to be mutually exclusive of this task.			
Instances	Lists of all instances of the task.			
Triggers	List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current name="" task="">#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers.</current>			
Notes	Lists all notes associated with this record.			
Versions	Stores copies of all previous versions of the current record. See Record Versioning.			

# **Viewing a Windows Task Instance**

When a Windows task is launched, the Controller creates a task instance record of that task.

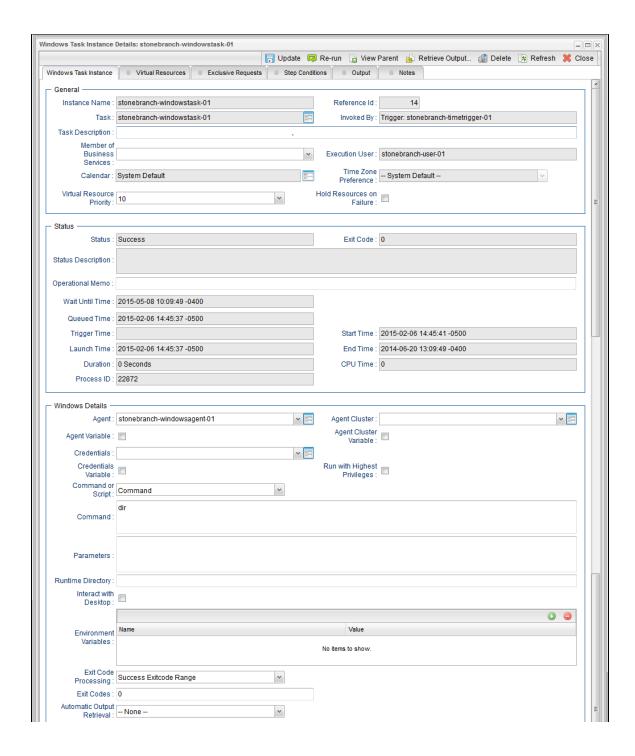

A task instance contains detailed information about a single execution of that task.

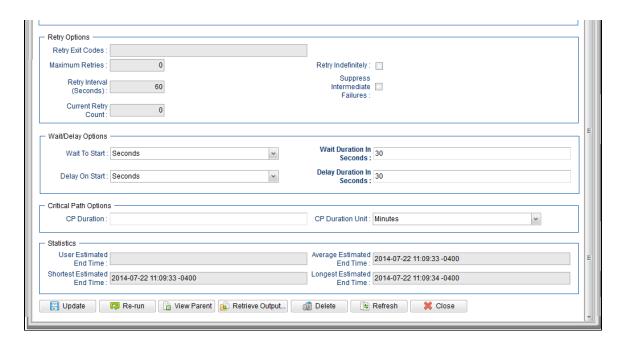

You can access a task instance from:

- Instances tab on the Windows Task Details for that task
- Activity Monitor
- Task Instances list

### **Windows Task Instance Details**

The following Windows Task Instance Details contains information on the execution of the task shown in the Windows Task Details.

## **Windows Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in Windows Task Instance Details.

Field Name	Description	
General	This section contains general information about the task instance.	
Instance Name	Name of this task instance.	
Reference Id	System-supplied; the Controller increments this number each time the task is run.	
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.	

Invoked by	System-supplied; how the task instance was launched.		
	Options:		
	<ul> <li>Trigger: (Trigger Name) Instance was launched by the named trigger.</li> <li>Workflow: (Workflow Name) Instance was launched by the named workflow.</li> <li>Manually Launched Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.</li> </ul>		
Task Description	Description of this record. (Maximum = 200 characters.)		
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.		
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.		
Calendar	Calendar associated with the task instance.		
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.		
	Options:		
	<ul> <li>System Default –         Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxx)</li> </ul>		
	Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.  • Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.		
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.		
	Options: 1 (high) - 20 (low).		
	Default is 10.		
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.		

Status	This section contains information about the current status of the task instance.			
Status	System-supplied; see Task Instance Statuses.			
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).			
Status Description	System-supplied; additional information, if any, about the status of the task instance.			
Operational Memo	User-defined operational memo.			
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)			
Critical	Indicates that this task is in the Critical Path of a workflow.			
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.			
Queued Time	System-supplied; Date and time the task was queued for processing.			
Trigger Time	System-supplied; Date and time the task instance was triggered.			
Launch Time	System-supplied; Date and time the task instance was launched.			
Start Time	System-supplied; Date and time the task instance started.			
End Time	System-supplied; Date and time the task instance completed.			
Duration	System-supplied; amount of time the task instance took to run.			

CPU Time	System-supplied; amount of CPU time the task took to run.
Process ID	System-supplied; ID of the process that was launched.
Windows Details	This section contains assorted detailed information about the task instance.
Agent	Name of the Agent resource that identifies the machine where the operation will run. If you do not specify an Agent, you must specify an Agent Cluster.
Agent Variable	Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the Agent Variable field to Yes and specify the Agent variable in the Agent Unresolved field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the Agent Variable field to No and specify the Agent reference in the Agent field.
Agent Cluster	Group of Agents, one of which the Controller will choose to run this task (compare with Cluster Broadcast). You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.
Agent Cluster Variable	Indication of whether the Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using an Agent Cluster reference to using an Agent Cluster variable, you must change the Agent Cluster Variable field to Yes and specify the Agent Cluster variable in the Agent Cluster Unresolved field. Conversely, to change from using an Agent Cluster variable to using an Agent Cluster reference, you must change the Agent Cluster Variable field to No and specify the Agent Cluster reference in the Agent Cluster field.
Credentials	Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.  Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

## Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials**Variable field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

#### Command or Script

Specifies whether a single command or a script is being executed.

#### Options:

- Command (default)
- Script

If the Windows/Linux Scripts Permitted Universal Controller system property is set to false:

- The Command or Script field is set to Command and is read-only.
- If the Command or Script field is set to Script, the field becomes modifiable so that you can change it to Command.

#### Note

For both command-based tasks that call a .vbs/.js file directly, and script-based tasks that also rely on the systems association with file extension, GUI-based wscript.exe is associated with the vbs and js file extensions. Without explicitly calling one or the other, the Controller would use wscript.exe.

The Agent system may need to be adjusted to properly use the Windows Scripting Host from the scheduler/agent environment.

The following command can be used to set the default script host to cscript.exe: C:\tmp>cscript //h:cscript //s

#### Command

Required if Command or Script = Command; Command being executed on the remote machine. Variables supported.

## Script

Required if Command or Script = Script; Name of the script in the Controller database that will be executed by this task.

#### Note

If you click the Details icon for a Script selected in this field, the Script Type field in the Details is read-only.

#### **Parameters**

Any arguments needed by the program to execute properly. Variables supported.

Runtime Directory	Directory from which the application should be executed. Variables supported.
Interact with Desktop	This option must be enabled for a task that runs an application with a GUI requiring some manual actions from a user (for example, clicking buttons or entering values).
	Note When using this option to display GUI applications on any version of Windows that enforces session 0 desktop isolation (that is, Windows Vista and later), the GUI will only be accessible from the interactive console session. Further, the task will execute using the credentials of the user logged into that session. This means that any GUI-based application executed via a Windows task will not be visible from a remote desktop session. It will be visible only from console of the interactive session that exists on the system itself (that is, the session you would see from a monitor attached directly to the Windows machine or by logging in via a VM's host UI).
Create Console	If Interact with Desktop is enabled; Allocates a new console for the process, rather than having it inherit one.
Environment Variables	Allows you to enter environment variables needed by the program to run.  To add a variable, click the + icon and enter a <b>Name</b> and <b>Value</b> . To delete a variable, select in the list of variables and click the - icon.  You can add a maximum of 4,000 characters for the combined Names and Values of all variables. The variable is listed in the space underneath.
Exit Code Processing	Specifies how the Controller should determine whether the executed command failed or completed successfully.  Options:  Success Exitcode Range Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field. Failure Exitcode Range Command is considered failed if its exit code falls within the range specified in the Exit Codes field. Success Output Contains Command is considered completed successfully if its output contains the text specified in the Scan Output For field. Failure Output Contains Command is considered failed if its output contains the text specified in the Scan Output For field. Step Conditions (z/OS only) Command is considered completed successfully/failed if any of its specified condition codes falls within the range specified under the Step Conditions tab (see Creating Step Conditions).

Output Type	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output.  Options:  Standard Output (STDOUT) Standard Error (STDERR) File
Exit Codes	Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.
Scan Output For	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this field as a regular expression.
Output File (for Exit Code Processing)	Required if Output Type = File; path and file name of the output file that should be scanned for the text in the Scan Output For field.
Automatic Output Retrieval	Specifies whether you want the Controller to automatically retrieve any output from the job and attach it to the task instance record.  Options:  None Do not attach any output to the task instance record. Standard Output Attach all standard output. Standard Error Attach standard error output. File Attach the file specified in the Output File field. Standard Output/Error Attach all standard output and standard error output.
	Note Tasks specifying Automatic Output Retrieval will fail with Start Failure if the Agent Output Prohibited field is true in the Details of the specified Agent.
Start Line	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Instructs the Controller to retrieve data beginning at the line indicated.  • If a <b>Start Line</b> value is not specified, the default is 1.  • If the <b>Start Line</b> value is <b>-1</b> , data will be retrieved starting at the end of the file.

Number of Lines	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Allows you to limit the retrieved data to the number of lines specified. If a Number of Lines value is not specified, the default is the value of the Retrieve Output Default Number Of Lines Universal Controller system property.
Scan Text	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Regex pattern that the Controller will search for a match for in STDOUT/STDERR or a specified file. The Controller will include the <b>Number of Lines</b> above and below the first line matched.  if the Regex pattern is not found, the following message is returned: OPSWISE WARNING - Scan text string not found.
Output File (for Automatic Output Retrieval)	Required if Automatic Output Retrieval = File; path and file name containing the output that you want automatically retrieved and attached to the task instance.
Retry Options	This section contains specifications for retrying the task.
Retry Exit Codes	Exit code range for which an auto-retry of tasks in FAILED status will occur. Exit code ranges must be in the same format as ranges specified in the Exit Codes field.  Maximum Retries must be greater than 0.
	If this field is empty, any exit code potentially will cause a retry.
Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval (Seconds)	User-defined; number of seconds between each retry.
Current Retry Count	System-supplied; current number of times that the Controller has retried the task after it first went to failure status.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:  • All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.  • Workflow conditional path processing; any Successors waiting on a failure path will not be released.  • Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which Suppress Intermediate Failures has been enabled.  • Any Workflow containing the Failed task instance will not transition to the Running/Problems status.

Next Retry Time	System-supplied for a task instance in the Failed status that is scheduled for automatic retry; Next time that a retry will be made. If a task instance is not scheduled for automatic retry, Next Retry Time does not display in the task instance Details.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.  Options are:  - None - Time Relative Time Duration Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	• None
	<ul> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> </ul>
	Same Day     Do not advance day.
	Next Day     Advance to the next day.
	Next Business Day
	Advance to the next business day.  • Sunday
	If today is not Sunday, advance to next Sunday.
	Monday     If today is not Monday, advance to next Monday.
	<ul> <li>Tuesday</li> <li>If today is not Tuesday, advance to next Tuesday.</li> </ul>
	Wednesday
	If today is not Wednesday, advance to next Wednesday.  Thursday
	If today is not Thursday, advance to next Thursday.  • Friday
	If today is not Friday, advance to next Friday.
	Saturday     If today is not Saturday, advance to next Saturday.
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.
Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.
	Options are:
	<ul> <li>None –</li> <li>Duration</li> <li>Seconds</li> </ul>

Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Time Options	This section contains time-related specifications for the task instance.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
	Valid values:
	None     Advance to the next day if the specified late start time is before the Created time of the task instance.     Same Day     Do not advance day.     Next Day     Advance to the next day.     Next Business Day     Advance to the next business day.     Sunday     If today is not Sunday, advance to next Sunday.     Monday     If today is not Monday, advance to next Monday.     Tuesday     If today is not Tuesday, advance to next Tuesday.     Wednesday     If today is not Tursday, advance to next Wednesday.     Thursday     If today is not Thursday, advance to next Thursday.     Friday     If today is not Thursday, advance to next Thursday.     Friday     If today is not Friday, advance to next Friday.     Saturday     If today is not Saturday, advance to next Saturday.     Nth Day     Advance to a specific number of days in the future.  Default is – None
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.  For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.  For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None Advance to the next day if the specified late finish time is before the Created time of the task instance.  • Same Day Do not advance day. • Next Day Advance to the next day. • Next Day Advance to the next day. • Next Business Day Advance to next Sunday. • Sunday If today is not Sunday, advance to next Sunday. • Monday If today is not Monday, advance to next Monday. • Tuesday If today is not Monday, advance to next Tuesday. • Wednesday If today is not Tuesday, advance to next Wednesday. • Thursday If today is not Thursday, advance to next Thursday. • Friday If today is not Friday, advance to next Friday. • Saturday If today is not Saturday, advance to next Saturday. • Nith Day Advance to a specific number of days in the future.  Default is - None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early Finish Day	
Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.
	Valid values:
	• None
	Advance to the next day if the specified early finish time is before the Created time of the task instance.  • Same Day
	Do not advance day.
	Next Day     Advance to the next day.
	Next Business Day
	Advance to the next business day.  • Sunday
	If today is not Sunday, advance to next Sunday.
	Monday     If today is not Monday, advance to next Monday.
	Tuesday
	If today is not Tuesday, advance to next Tuesday.  • Wednesday
	If today is not Wednesday, advance to next Wednesday.
	Thursday     If today is not Thursday, advance to next Thursday.
	• Friday  If today is not Friday, advance to payt Friday.
	If today is not Friday, advance to next Friday.  • Saturday
	If today is not Saturday, advance to next Saturday.  • Nth Day
	Advance to a specific number of days in the future.
	Default is – None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.

CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.
	Options:
	<ul><li>Seconds</li><li>Minutes</li><li>Hours</li></ul>
	Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.
Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.
	Options are:
	<ul> <li> None No restriction for this task.</li> <li>Run Restriction for when this task will be run.</li> <li>Skip Restriction for when this task will be skipped.</li> <li>Hold Restriction for when this task will be held.</li> </ul>
	If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.
Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.
	Options are:
	• - None -
	No period of restriction for this task.  • Before
	Restriction is valid if the date is before the Before Date value.  • After
	Restriction is valid if the date is after the After Date value.
	<ul> <li>Span         Restriction is valid if the date is before the Before Date value and after After Date value.     </li> <li>On</li> </ul>
	Restriction is valid if the date is one of the Date List values.
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.

Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instance.
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Status History	History of all statuses that the task instance has gone through.
Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.
Update	Saves updates to the record.

Force Finish	See Force Finishing a Task.
Hold	Places the task instance on Hold (see Putting a Task on Hold).
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.
Re-run	See Re-running a Task.
View Parent	Displays the task instance Details for the parent Workflow of this task instance.
Retrieve Output	See Retrieving Output.
Delete	Deletes the current record.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task instance.
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.
Virtual Resources	Lists all Virtual Resources to which this task is assigned.
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.
Output	Displays output generated from the process, if any, based on specifications provided by the user in the Automatic Output Retrieval fields in the task Details.  If automatic output retrieval was not available or was not selected, output can be obtained by clicking the Retrieve Output button.
Notes	Lists all notes associated with this record.

# **Running a Windows Task**

You can run a Windows task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the Windows tasks list or Windows Task Details Action menu.
- As part of a Workflow.
  Specify triggers that run the task automatically based on times or events.

# **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

# zOS Task

Information on z/OS tasks is contained on the following pages:

- Creating and Running a z/OS Task
  Special Processing on z/OS Tasks
  Creating Step Conditions
  Creating Step Actions
  Creating Restart Criteria

# **Creating and Running a zOS Task**

- Before You Begin
- Built-In Variables
- Creating a z/OS Task
  - z/OS Task Details
  - z/OS Task Details Field Descriptions
- Viewing a z/OS Task Instance
  - z/OS Task Instance Details
  - z/OS Task Instance Details Field Descriptions
- Running a z/OS Task
- Monitoring Task Execution

# **Before You Begin**

The z/OS task allow you to run a platform-specific application on a z/OS machine. To run a z/OS task, you must first complete the following tasks:

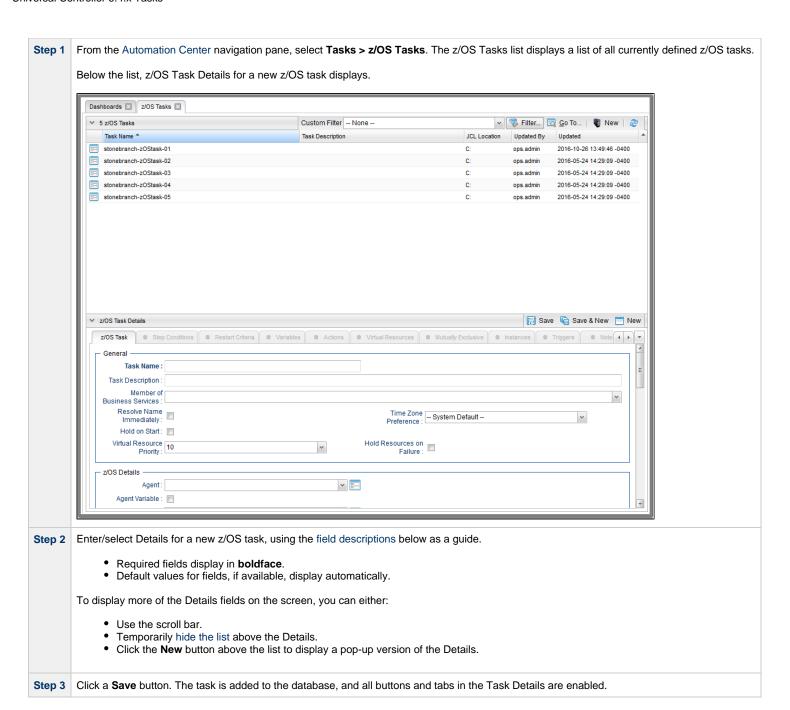

- Install Universal Agent for z/OS on a z/OS machine.
- · Launch the Agent. When the Agent connects with the Universal Controller, it automatically creates an Agent resource definition in the database.
- · Optionally, customize the Agent heartbeat and log levels, as described in z/OS Agent Details Field Descriptions.

# **Built-In Variables**

The following built-in variables can be used in a z/OS task to pass data where appropriate:

- Agent-Based Task Instance variables
- Task Instance variables
- z/OS Task Instance variables

# Creating a z/OS Task

#### Note

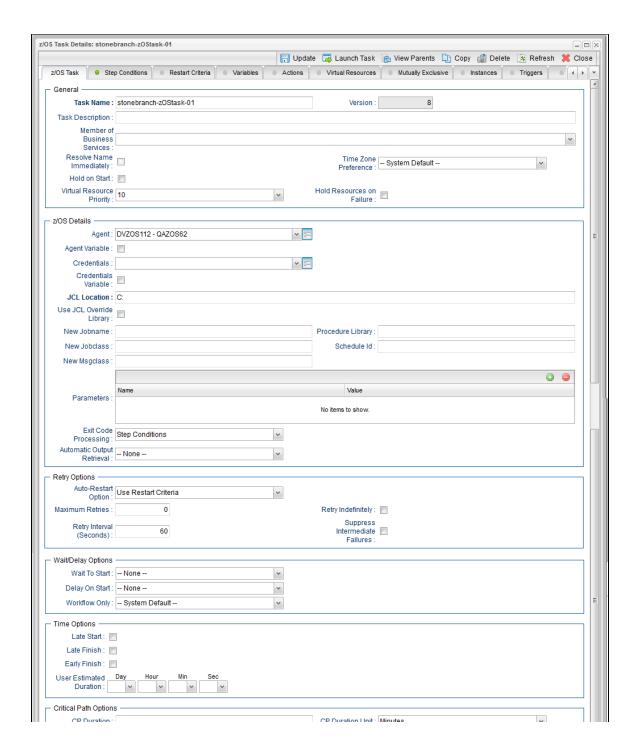

To open an existing record on the list, either:

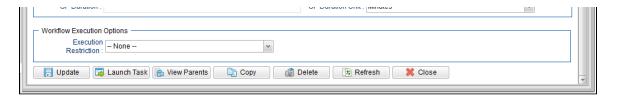

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click **Open In Tab** in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

# z/OS Task Details

The following z/OS Task Details is for an existing Linux/Unix task.

Depending on the values that you enter / select for these fields, and whether or not the z/OS task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the z/OS Task Details.

# z/OS Task Details Field Descriptions

The following table describes the fields, buttons, and tabs that display in the z/OS Task Details.

Field Name	Description
General	This section contains general information about the task.
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.

Hold Reason	Information about why the task will be put on hold when it starts.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
z/OS Details	This section contains assorted detailed information about the task.
Agent	Name of the Agent resource that identifies the machine where the operation will run.
Agent Variable	Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the Agent Variable field to Yes and specify the Agent variable in the Agent Unresolved field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the Agent Variable field to No and specify the Agent reference in the Agent field.
Credentials	Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.  Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

#### Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials Variable** field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

## JCL Location

File and member name containing the JCL script.

When you are using the JCL\_LIBRARY feature, you can substitute the name of the library with a string starting with "&", that names the library specified in the uags.conf file with the JCL\_library definitions. For example, the name of a job might look like the following:

&PRODLIB(PAYJOB01)

# Use JCL Override Library

Allows the task to work with a JCL override library on the target system. If this option is selected, the Agent will check the JCL override path (specified in JCL Override Location) before submitting the job from JCL Location.

If a JCL member is found at the override path, the job is submitted from there. Otherwise, the Agent will look to the JCL Location path for submission.

The task instance will display the actual path that was used for job submission in Submitted JCL Location.

## JCL Override Location

Required if Use JCL Override Library is selected; Specifies the file and member name potentially containing an override JCL script.

The Agent will check this location for JCL before looking in the standard JCL Location. If JCL is found in this location, the job will be submitted from there. If JCL is not found in this location, the Agent will submit the job from the standard JCL Location.

Missing override JCL is not considered an error condition.

As with JCL Location, when you are using the JCL\_LIBRARY feature, you can substitute the name of the library with a string starting with "&" that names the library specified in the uags.conf file with the JCL\_library definitions.

## Delete Override JCL

Optional if Use JCL Override Library is selected; Allows the task to define criteria that will control the automated clean-up of the override JCL. If this option is not selected, the Controller and Agent will take no action to delete the override JCL from the target system.

# Override Required if Delete Override JCL is selected: Specifies the number of successful override instances that must occur before the override JCL library member is deleted. Instance Count for When the deletion criteria has been satisfied, the Controller will instruct the Agent to delete the member specified in JCL Override Location. Deletion An override instance is considered successful only if the ending state in the controller is SUCCESS. Note Manual resubmissions of a task instance do not increment the tracked number of successful override instances that go towards satisfying the deletion criteria. If a task is not submitted from the override location (that is, no override member was found), the task's "successful override instance count" is reset to 0. Last If Delete Override JCL is selected; system-supplied. Displays after the specified override JCL member is deleted. The date and time the last override JCL deletion occurred. Override Deletion Number of If Delete Override JCL is selected; Read only; system-supplied. Indicates the number of successful override instances that have occurred for this task. This number is checked Override against the deletion criteria to determine when the override JCL member should be deleted. Instances Note This number is automatically reset to 0 by the system if a task instance does not submit from override JCL (that is, no override member was found). New Jobname Job name that will replace the one in the JCL member. This allows you to override the value in your JCL from the Controller without having to modify the JCL. This value should be validated before the job is launched to avoid JES start failures. The syntax of a job name is: 1-8 characters Upper case • Name must start with an alphabetic or \$, #, @ character. • Remaining characters are alphanumeric or \$, #, @. No spaces or tabs. New Jobclass New Jobclass to replace the one in the JCL member. This allows you to override the value in your JCL from the Controller without having to modify the JCL. New New MSGCLASS to replace the one in the JCL member. This allows you to override the value in your JCL from the Controller without having to modify the JCL. Msqclass

## Procedure Library

The PROCLIB field allows for defining a JES2 PROCLIB control statement in the job JCL. For example, a PROCLIB value of PROC01 will result in the following JES2 control statement generated in the job JCL:

/\*JESPARM PROCLIB=PROC001

The PROCLIB value must refer to a ddname defined in the JES2 procedure. Refer to IBM MVS JCL Reference for more information regarding the JES2 PROCLIB control statement.

## Schedule ID

CA7 Schedule ID; for CA7 toleration only (see CA7/CA11 Toleration).

#### **Parameters**

Displays a list of parameters that will be inserted into the JCL. Each parameter consists of a Name and a Value. You can enter as many parameters as needed.

To add a parameter, click the + icon; add a Name and Value, and click the **Update** button. To delete a parameter, click the parameter on the list, the - icon, and the **Update** button.

Each parameter that you enter creates a separate JCL construct called the SET command. Each one appears as a new line inserted dynamically into the JCL submitted to the Controller for the current execution. The JCL is not permanently modified.

For example, you might specify a parameter Name = RUNTYPE and Value = PROD. This results in the following JCL SET statement being inserted in the job after the job card:

// SET RUNTYPE=PROD

The Parameter fields also support two additional special functions:

- They allow you to specify any steps you want skipped during the job run. See Skipping Steps during Initial Run for detailed instructions.
- They allow you to add data to DD\* input streams. See Using Variables in JCL and In-Stream Data Sets for detailed instructions.

## Exit Code Processing

Specifies how the Controller should determine whether the executed command failed or completed successfully.

#### Options:

- Success Exitcode Range
- Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field.
- Failure Exitcode Range
- Command is considered failed if its exit code falls within the range specified in the Exit Codes field.
- Success Output Contains
  - Command is considered completed successfully if its output contains the text specified in the Scan Output For field.
- Failure Output Contains
  - Command is considered failed if its output contains the text specified in the Scan Output For field.
- Step Conditions (z/OS only)
  - Command is considered completed successfully/failed if any of its specified condition codes falls within the range specified under the Step Conditions tab (see Creating Step Conditions).

#### Note

If Step Conditions has been selected for Exit Code Processing, and you then select a different option, a confirmation pop-up displays to warn that any defined Step Conditions will be removed.

## Output Type

Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output.

#### Options:

- Standard Output (STDOUT)
- Standard Error (STDERR)
- File

# Scan Output For

Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this field as a regular expression.

## Output File (for Exit Code Processing)

Required if Output Type = File; path and file name of the output file that should be scanned for the text in the Scan Output For field.

#### Exit Codes

Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.

Automatic Output Retrieval	Specifies whether you want the Controller to automatically retrieve output from the job and attach it to the task instance record.  Options:  None Do not attach any output to the task instance record. File Attach the file specified in the Output File field. Joblog Attach output from the z/OS joblog.
	Note Tasks specifying Automatic Output Retrieval will fail with Start Failure if the Agent Output Prohibited field is true in the Details of the specified Agent.
Start Line	If Automatic Output Retrieval = Joblog or File; Allows you to instruct the Controller to retrieve data beginning at the line indicated. If a Start Line value is not specified on the screen, the default is 1.
Number of Lines	If Automatic Output Retrieval = Joblog or File; Allows you to limit the retrieved data to the number of lines specified. If a Number of Lines value is not specified, the default is the value of the Retrieve Output Default Maximum Lines Universal Controller system property.
Scan Text	If Automatic Output Retrieval = Joblog or File; Instructs the Controller to scan the data for the text specified and retrieve only that. The Controller will process this field as a regular expression.
Output File (for Automatic Output Retrieval)	Required if Automatic Output Retrieval = File; path and file name containing the output that you want automatically retrieved and attached to the task instance.
Retry Options	This section contains specifications for retrying the task.

## Auto-Restart Option

Allows the z/OS job to be resubmitted with controlled step selection. This option is processed when/if a task transitions to a failed state. It works in conjunction with the Maximum Retries, Retry Interval, and Retry Indefinitely options.

#### Note

The Maximum Retries value must be greater than 0 for the Auto-Restart Option to be processed.

#### Options:

- None
- No job steps will be automatically selected for restart.
- Restart From First Job Step
  - All restartable job steps will be selected for restart.
- Restart From Failed Job Step
- All restartable job steps from the failed step to the last job step will be selected for restart.
- Use Restart Criteria

The entries in the Restart Criteria tab will be evaluated. If a Restart Criteria entry matches the failure scenario, the step selection will be based on the option specified in the matching Restart Criteria entry (see Creating Restart Criteria).

If you select an option other that **None** for a task that ends in a failed state, audit records will be generated to record the step selection that took place for the restart. The audit records include all restart options, criteria matching, and directives that were used to select the set of job steps to be re-run. z/OS auto-restart audit records show up as audit type **z/OS Auto-Restart** from source **Task Instance**.

#### Note

If Use Restart Criteria has been selected for Auto-Restart Option, and you then select a different option, a confirmation pop-up displays to warn that any defined Restart Criteria will be removed.

Maximum	
Retries	

User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.

## Retry Indefinitely

User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.

#### Retry Interval (Seconds)

User-defined; number of seconds between each retry.

Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:
	<ul> <li>All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.</li> </ul>
	<ul> <li>Workflow conditional path processing; any Successors waiting on a failure path will not be released.</li> </ul>
	<ul> <li>Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which Suppress Intermediate Failures has been enabled.</li> </ul>
	Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	<ul> <li>None –</li> <li>Time</li> <li>Relative Time</li> <li>Duration</li> <li>Seconds</li> </ul>
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

# Wait Day Constraint If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day. Valid values: -- None --• If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. Same Dav Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Default is - None --. Wait If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task. Duration Wait Duration In If Wait To Start = Seconds; Number of seconds to wait before starting the task. Seconds Delay On Start Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified. Options are: None – Duration Seconds

Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  Options are:  • System Default Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.)  • Yes Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  • No Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

# Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future. Default is - None --. Late Start Nth Amount If Late Start Day Constraint = Nth Day; Number of days to advance. Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Late Finish Type	Required if Late Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:
	<ul> <li> None Advance to the next day if the specified late finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul>
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.
Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.

Early Finish Early Finish Type	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.  Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  • None Advance to the next day if the specified early finish time is before the Created time of the task instance. • Same Day Do not advance day. • Next Day Advance to the next day. • Next Business Day Advance to the next business day. • Sunday If today is not Sunday, advance to next Sunday. • Monday If today is not Monday, advance to next Monday. • Tuesday If today is not Tuesday, advance to next Tuesday. • Wednesday If today is not Tuesday, advance to next Wednesday. • Thursday If today is not Thursday, advance to next Thursday. • Friday If today is not Triday, advance to next Thursday. • Friday If today is not Friday, advance to next Friday. • Saturday If today is not Friday, advance to next Saturday. • Nth Day Advance to a specific number of days in the future.
Early Finish Nth Amount	Default is – None  If Early Finish Day Constraint = Nth Day; Number of days to advance.

Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds  Minutes  Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.

# Execution Restriction Specification for whether or not there is a restriction for this task to be run, skipped, or held. Options are: -- None -- No restriction for this task. • Run Restriction for when this task will be run. • Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held. If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow. Restriction Period If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted. Options are: None – No period of restriction for this task. Restriction is valid if the date is before the Before Date value. Restriction is valid if the date is after the After Date value. Restriction is valid if the date is before the Before Date value and after After Date value. Restriction is valid if the date is one of the Date List values. Before Date If Restriction Period = Before or Span; Date before which the restriction is valid. Before Time If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid. After Date If Restriction Period = After or Span; Date after which the restriction is valid. After Time If Restriction Period = After or Span; Time on the selected date after which the restriction is valid. Date List If Restriction Period = On; Date(s) on which the restriction is valid. **Statistics** This section contains time-related statistics for task instances of the task.

First Time Ran	System-supplied; date and time this task first ran.
Last Time Ran	System-supplied; date and time the task last ran.
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.
Lowest Instance Time	System-supplied; shortest amount of time this task has taken to run.
Average Instance Time	System-supplied; average amount of time this task takes to run.
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.
Number of Instances	System-supplied; number of instances in the database for this task.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Buttons	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Save	Saves a new task record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new task.
Update	Saves updates to the record.

Launch Task	Manually launches the task.
View Parents	Displays a list of any parent Workflow tasks for this task.
Сору	Creates a copy of this task, which you are prompted to rename.
Delete	Deletes the current record.
	<ul> <li>Note         You cannot delete a task if it is either:         <ul> <li>Specified in an enabled Trigger.</li> <li>The only task specified in a disabled Trigger.</li> </ul> </li> </ul>
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task.
Tabs	This section identifies the tabs across the top of the Task Details that provide access to additional information about the task.
Step Conditions	Lists all step conditions defined for this task.
Restart Criteria	Displays a list of all restart criteria defined for this task.
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.

# Actions Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task. Events are: Task instance status Exit codes Late start · Late finish Early finish Actions are: Abort the task if certain events occur. For details, see Abort Actions. **Abort Action** Send an email if certain events occur. For details, see Email Notification Actions. **Email Notification Set Variable** Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow. **SNMP** Send an email if certain events occur. For details, see SNMP Notification Actions. **Notification System** Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions. Operation Virtual Lists all Virtual Resources to which this task is assigned. Resources Mutually Lists all tasks that have been set to be mutually exclusive of this task. **Exclusive** Lists all instances of the task. Instances **Triggers** List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current task name>#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers. Notes Lists all notes associated with this record. Versions Stores copies of all previous versions of the current record. See Record Versioning.

# Viewing a z/OS Task Instance

When a z/OS task is launched, the Controller creates a task instance record of that task.

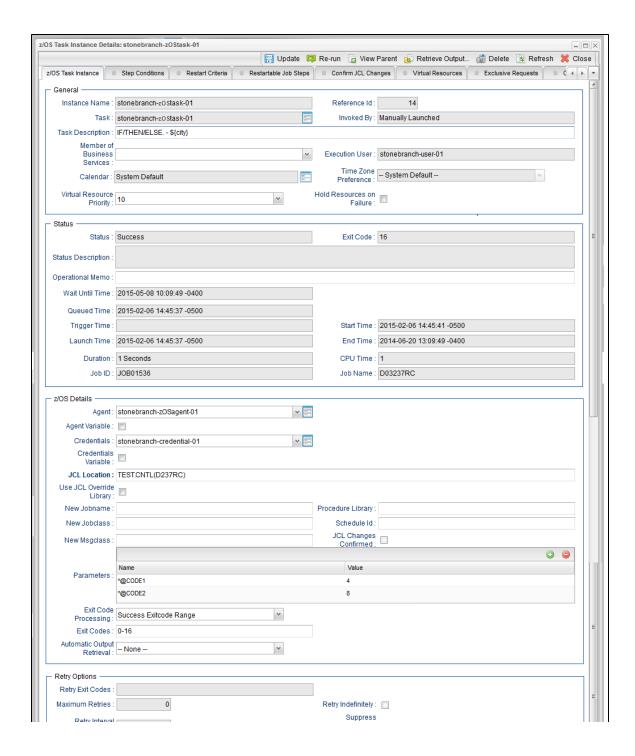

A task instance contains detailed information about a single execution of that task.

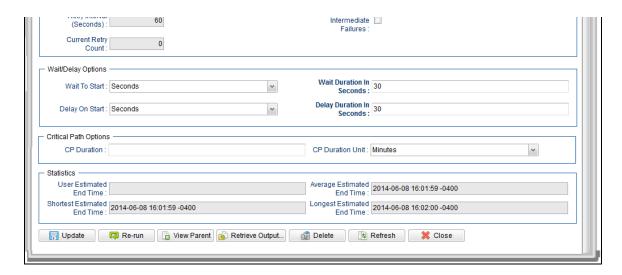

You can access a task instance from:

- Instances tab on the z/OS Task Details for that task
- Activity MonitorTask Instances list

### z/OS Task Instance Details

The following z/OS Task Instance Details contains information on the successful completion of a z/OS task.

# z/OS Task Instance Details Field Descriptions

The following table describes the fields, buttons, and tabs that display in z/OS Task Instance Details.

Field Name	Description
General	This section contains general information about the task instance.
Instance Name	Name of this task instance.
Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.

Invoked by	System-supplied; how the task instance was launched.
	Options:
	<ul> <li>Trigger: (Trigger Name) Instance was launched by the named trigger.</li> <li>Workflow: (Workflow Name) Instance was launched by the named workflow.</li> <li>Manually Launched Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.</li> </ul>
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.
	Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.

Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)
Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.
End Time	System-supplied; Date and time the task instance completed.
Duration	System-supplied; amount of time the task instance took to run.

Job identifier of the job executed by the task instance.
Name of the job executed by the task instance.
This section contains assorted detailed information about the task instance.
Name of the Agent resource that identifies the machine where the operation will run.
Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
Note When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the Agent Variable field to Yes and specify the Agent variable in the Agent Unresolved field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the Agent Variable field to No and specify the Agent reference in the Agent field.
Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.  Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.
Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
Note When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the Credentials Variable field to Yes and specify the Credentials variable in the Credentials Unresolved field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the Credentials Variable field to No and specify the Credentials reference in the Credentials field.

JCL Location	File and member name containing the JCL script.  When you are using the JCL_LIBRARY feature, you can substitute the name of the library with a string starting with "&", that names the library specified in the uags.conf file with the JCL_library definitions. For example, the name of a job might look like the following:  © PRODLIB (PAYJOB01)
Use JCL Override Library	Allows the task to work with a JCL override library on the target system. If this option is selected, the Agent will check the JCL override path (specified in JCL Override Location) before submitting the job from JCL Location.  If a JCL member is found at the override path, the job is submitted from there. Otherwise, the Agent will look to the JCL Location path for submission.  The task instance will display the actual path that was used for job submission in Submitted JCL Location.
JCL Override Location	If Use JCL Override Library is selected; Required. Specifies the file and member name potentially containing an override JCL script.  The Agent will check this location for JCL before looking in the standard JCL Location. If JCL is found in this location, the job will be submitted from there. If JCL is not found in this location, the Agent will submit the job from the standard JCL Location.  Missing override JCL is not considered an error condition.  As with JCL Location, when you are using the JCL_LIBRARY feature, you can substitute the name of the library with a string starting with "&" that names the library specified in the uags.conf file with the JCL_library definitions.
Delete Override JCL	If Use JCL Override Library is selected; Optional. Allows the task to define criteria that will control the automated clean-up of the override JCL. If this option is not selected, the Controller and Agent will take no action to delete the override JCL from the target system.
Submitted JCL Location	System-supplied; actual path that was used for job submission.
Override Instance Count for Deletion	If Delete Override JCL is selected; Required. Specifies the number of successful override instances that must occur before the override JCL library member is deleted.  When the deletion criteria has been satisfied, the Controller will instruct the Agent to delete the member specified in JCL Override Location.  An override instance is considered successful only if the ending state in the controller is SUCCESS.
	Note Manual resubmissions of a task instance do not increment the tracked number of successful override instances that go towards satisfying the deletion criteria.  If a task is not submitted from the override location (that is, no override member was found), the task's "successful override instance count" is reset to 0.

#### Number of Override Instances

If Delete Override JCL is selected; Read only; system-supplied. Indicates the number of successful override instances that have occurred for this task. This number is checked against the deletion criteria to determine when the override JCL member should be deleted.

#### Note

This number is automatically reset to 0 by the system if a task instance does not submit from override JCL (that is, no override member was found).

#### New Jobname

Job name that will replace the one in the JCL member. This allows you to override the value in your JCL from the Controller without having to modify the JCL.

This value should be validated before the job is launched to avoid JES start failures.

The syntax of a job name is:

- 1-8 characters
- Upper case
- Name must start with an alphabetic or \$, #, @ character.
- Remaining characters are alphanumeric or \$, #, @.
- No spaces or tabs.

#### New Jobclass

New Jobclass to replace the one in the JCL member. This allows you to override the value in your JCL from the Controller without having to modify the JCL.

#### New Msgclass

New MSGCLASS to replace the one in the JCL member. This allows you to override the value in your JCL from the Controller without having to modify the JCL.

#### Procedure Library

The PROCLIB field allows for defining a JES2 PROCLIB control statement in the job JCL. For example, a PROCLIB value of PROC01 will result in the following JES2 control statement generated in the job JCL:

/\*JESPARM PROCLIB=PROC001

The PROCLIB value must refer to a ddname defined in the JES2 procedure. Refer to IBM MVS JCL Reference for more information regarding the JES2 PROCLIB control statement.

#### Schedule ID

CA7 Schedule ID; for CA7 toleration only (see CA7/CA11 Toleration).

#### JCL Changes Confirmed

If Status = Confirmation Required; indicates that JCL changes have been confirmed. You cannot rerun a job if this field is not selected.

#### **Parameters**

Displays a list of parameters that will be inserted into the JCL. Each parameter consists of a Name and a Value. You can enter as many parameters as needed.

To add a parameter, click the + icon; add a Name and Value, and click the **Update** button. To delete a parameter, click the parameter on the list, the - icon, and the **Update** button.

Each parameter that you enter creates a separate JCL construct called the SET command. Each one appears as a new line inserted dynamically into the JCL submitted to the Controller for the current execution. The JCL is not permanently modified.

For example, you might specify a parameter Name = RUNTYPE and Value = PROD. This results in the following JCL SET statement being inserted in the job after the job card:

// SET RUNTYPE=PROD

The Parameter fields also support two additional special functions:

- They allow you to specify any steps you want skipped during the job run. See Skipping Steps during Initial Run for detailed instructions.
- They allow you to add data to DD\* input streams. See Using Variables in JCL and In-Stream Data Sets for detailed instructions.

#### Exit Code Processing

Specifies how the Controller should determine whether the executed command failed or completed successfully.

#### Options:

- Success Exitcode Range
- Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field.
- Failure Exitcode Range
- Command is considered failed if its exit code falls within the range specified in the Exit Codes field.
- Success Output Contains
- Command is considered completed successfully if its output contains the text specified in the Scan Output For field.
- Failure Output Contains
- Command is considered failed if its output contains the text specified in the Scan Output For field.
- Step Conditions (z/OS only)
- Command is considered completed successfully/failed if any of its specified condition codes falls within the range specified under the Step Conditions tab (see Creating Step Conditions).

#### Note

If Step Conditions has been selected for Exit Code Processing, and you then select a different option, a confirmation pop-up displays to warn that any defined Step Conditions will be removed.

#### Output Type

Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output.

#### Options:

- Standard Output (STDOUT)
- Standard Error (STDERR)
- File

Scan Output For	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this field as a regular expression.
Output File (for Exit Code Processing)	Required if Output Type = File; path and file name of the output file that should be scanned for the text in the Scan Output For field.
Exit Codes	Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.
Automatic Output Retrieval	Specifies whether you want the Controller to automatically retrieve any output from the job and attach it to the task instance record.  Options:  None Do not attach any output to the task instance record. Standard Output Attach all standard output. Standard Error Attach standard error output. File Attach the file specified in the Output File field. Standard Output/Error Attach all standard output and standard error output.  Note Tasks specifying Automatic Output Retrieval will fail with Start Failure if the Agent Output Prohibited field is true in the Details of the specified Agent.
Start Line	If Automatic Output Retrieval = Joblog or File; Allows you to instruct the Controller to retrieve data beginning at the line indicated. If a Start Line value is not specified on the screen, the default is 1.
Number of Lines	If Automatic Output Retrieval = Joblog or File; Allows you to limit the retrieved data to the number of lines specified. If a Number of Lines value is not specified, the default is the value of the Retrieve Output Default Maximum Lines Universal Controller system property.
Scan Text	If Automatic Output Retrieval = Joblog or File; Instructs the Controller to scan the data for the text specified and retrieve only that. The Controller will process this field as a regular expression.

Output File (for Automatic Output Retrieval)	Required if Automatic Output Retrieval = File; path and file name containing the output that you want automatically retrieved and attached to the task instance.
Retry Options	This section contains specifications for retrying the task.
Auto-Restart Option	Allows the z/OS job to be resubmitted with controlled step selection. This option is processed when/if a task transitions to a failed state. It works in conjunction with the Maximum Retries, Retry Interval, and Retry Indefinitely options.
	Note The Maximum Retries value must be greater than 0 for the Auto-Restart Option to be processed.
	<ul> <li>None     No job steps will be automatically selected for restart.</li> <li>Restart From First Job Step     All restartable job steps will be selected for restart.</li> <li>Restart From Failed Job Step     All restartable job steps from the failed step to the last job step will be selected for restart.</li> <li>Use Restart Criteria     The entries in the Restart Criteria tab will be evaluated. If a Restart Criteria entry matches the failure scenario, the step selection will be based on the option specified in the matching Restart Criteria entry (see Creating Restart Criteria).</li> </ul>
	records include all restart options, criteria matching, and directives that were used to select the set of job steps to be re-run. z/OS auto-restart audit records show up as audit type z/OS Auto-Restart from source Task Instance.
	Note If Use Restart Criteria has been selected for Auto-Restart Option, and you then select a different option, a confirmation pop-up displays to warn that any defined Restart Criteria will be removed.
Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval	User-defined; number of seconds between each retry.

(Seconds)

Current Retry Count	System-supplied; current number of times that the Controller has retried the task after it first went to failure status.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:
	<ul> <li>All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.</li> </ul>
	<ul> <li>Workflow conditional path processing; any Successors waiting on a failure path will not be released.</li> </ul>
	• Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which <b>Suppress Intermediate Failures</b> has been enabled.
	Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
Next Retry Time	System-supplied for a task instance in the Failed status that is scheduled for automatic retry; Next time that a retry will be made. If a task instance is not scheduled for automatic retry, Next Retry Time does not display in the task instance Details.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	<ul> <li>- None -</li> <li>Time</li> <li>Relative Time</li> <li>Duration</li> <li>Seconds</li> </ul>
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

### Wait Day Constraint If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day. Valid values: -- None --• If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. Same Dav Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Default is - None --. Wait If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task. Duration Wait **Duration In** If Wait To Start = Seconds; Number of seconds to wait before starting the task. Seconds Delay On Start Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified. Options are: None – Duration Seconds

Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Time Options	This section contains time-related specifications for the task instance.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.

### Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future. Default is - None --. Late Start Nth Amount If Late Start Day Constraint = Nth Day; Number of days to advance. Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.	
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.	
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.	
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.	
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.	

Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  • None     Advance to the next day if the specified early finish time is before the Created time of the task instance. • Same Day     Do not advance day. • Next Day     Advance to the next day. • Next Business Day     Advance to the next business day. • Sunday     If today is not Sunday, advance to next Sunday. • Monday     If today is not Monday, advance to next Monday. • Tuesday     If today is not Tuesday, advance to next Tuesday. • Wednesday     If today is not Turusday, advance to next Wednesday. • Thursday     If today is not Turusday, advance to next Wednesday. • Thursday     If today is not Turusday, advance to next Thursday. • Friday     If today is not Friday, advance to next Friday. • Saturday     If today is not Saturday, advance to next Saturday. • Nit Day     Advance to a specific number of days in the future.  Default is None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.

# CP Duration (Resolved)

Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.

#### CP Duration Unit

Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select **Minutes** in this field.

#### Options:

- Seconds
- Minutes
- Hours

Default is Minutes.

### Workflow Execution Options

This section contains Execution Restriction specifications for the task if it is within a Workflow.

# Execution Restriction

Specification for whether or not there is a restriction for this task to be run, skipped, or held.

#### Options are:

- · -- None -- No restriction for this task.
- Run Restriction for when this task will be run.
- Skip Restriction for when this task will be skipped.
- Hold Restriction for when this task will be held.

If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

#### Restriction Period

If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.

#### Options are:

- None
  - No period of restriction for this task.
- Before
  - Restriction is valid if the date is before the Before Date value.
- After
  - Restriction is valid if the date is after the After Date value.
- Span
- Restriction is valid if the date is before the Before Date value and after After Date value.
- On

Restriction is valid if the date is one of the Date List values.

Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.	
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.	
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.	
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.	
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.	
Statistics	This section contains time-related statistics for the task instance.	
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.	
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.	
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.	
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.	
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.	
Metadata	This section contains Metadata information about this record.	
UUID	Universally Unique Identifier of this record.	
Updated By	Name of the user that last updated this record.	
Updated	Date and time that this record was last updated.	
Created By	Name of the user that created this record.	
Created	Date and time that this record was created.	
Status History	History of all statuses that the task instance has gone through.	

Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.	
Update	Saves updates to the record.	
Force Finish	See Force Finishing a Task.	
Hold	Places the task instance on Hold (see Putting a Task on Hold).	
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.	
Re-run	See Re-running a Task.	
View Parent	Displays the task instance Details for the parent Workflow of this task instance.	
Retrieve Output	See Retrieving Output.	
Delete	Deletes the current record.	
Refresh	Refreshes any dynamic data displayed in the Details.	
Close	For pop-up view only; closes the pop-up view of this task instance.	
Tabs	This section identifies the tabs across the top of the z/OS Task Instance Details that provide access to additional information about the task instance.	
Step Conditions	Lists all step conditions defined for this task.	
Restart Criteria	Displays a list of all restart criteria defined for this task.	
Restartable Job Steps	(See Re-running a z/OS Task.)	
Confirm JCL Changes	(See Re-running a z/OS Task.)	

Virtual Resources	Lists all Virtual Resources to which this task is assigned.	
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.	
Output	Displays output generated from the process, if any, based on specifications provided by the user in the Automatic Output Retrieval fields in the task Details.  If automatic output retrieval was not available or was not selected, output can be obtained by clicking the Retrieve Output button.	
Notes	Lists all notes associated with this record.	

# Running a z/OS Task

You can run a z/OS task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the z/OS tasks list or z/OS Task Details Action menu.
- As part of a Workflow.
- Specify triggers that run the task automatically based on times or events.

# **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

# **Special Processing on zOS Tasks**

- Overview
- Using Variables in JCL and In-Stream Data Sets
  - JCL Symbolic Parameters
  - Universal Controller Parameters
- Skipping Steps during Initial Run
- Overriding Key JCL Parameters from Universal Controller
- Disabling Automatic Data Set Deletion
- Re-running a z/OS Task Instance
  - Confirming JCL Changes
  - Re-running a z/OS Task Instance in Start Failure Status
  - Re-run a z/OS Task Instance from a Specific Step
  - Restartable Job Steps List Column Descriptions
  - Confirm JCL Changes Tab Column Descriptions
- Interactively Ignoring a Step Code to Complete a Task
- CA7/CA11 Toleration
  - Non-Restartable Customized Job Steps
  - SCHID Overriding the CA7 Schedule ID
- Non-Restartable Job Steps
- Viewing Re-run Reports
- Viewing Audit Trails on a Restart

### **Overview**

The following special processing features are available for running z/OS tasks:

- Using Variables in JCL and In-Stream Data Sets
- Skipping Steps during Initial Run
- Overriding Key JCL Parameters from Universal Controller
- Disabling Automatic Data Set Deletion

The following failure processing features are available for handling job failures:

- Re-running a z/OS Task Instance
- Interactively Ignoring a Step Code to Force a Task to Complete

The Controller supports compatibility with other schedulers:

CA7/CA11 Toleration

The Controller provides the following reports that track error processing:

- Viewing Re-run Reports
- Viewing Audit Trails on a Restart

Each of these features is described in detail below.

# **Using Variables in JCL and In-Stream Data Sets**

There are two categories of variables that can be defined in z/OS task Details:

- JCL Symbolic Parameters
- Universal Controller Parameters

Parameter values can use Universal Controller built-in or user-defined variables.

#### **JCL Symbolic Parameters**

Use the z/OS Task Details Parameters field to specify JCL symbolic parameters to be used in the JCL.

Any parameter name that does not start with \*@ is considered a JCL symbolic parameter. JCL symbolic parameters result in the Controller adding a JCL SET statement to the JCL before the first step EXEC statement.

As an example, a z/OS Task parameter name of PHLQ and value of APP.PROD will result in the following JCL SET statement being added to the JCL:

```
// SET PHLQ=APP.PROD
```

The PHLQ symbolic parameter in the example above can then be used in the remaining JCL as described by the IBM JCL Reference.

#### **Universal Controller Parameters**

Use the z/OS Task Details Parameters field to specify parameters that can be used in any JCL statement and in in-stream data sets.

In-stream data sets are typically defined with a DD \* JCL statement. the Controller will substitute the parameter values in the JCL statements and in the in-stream data before the JCL is submitted to JES.

Universal Controller parameters are defined with a parameter name that starts with the character sequence \*@. The parameters are referenced in the JCL and in-stream data by prefixing the parameter name with the @ character.

The following steps add a Universal Controller parameter with the name \*@DATE1 and a value of 20110601:

Step 1	Open the z/OS task.	
Step 2	n the Parameters field, click the + icon.	
Step 3	Add a parameter in the following format:	
	<ul> <li>Name is the name of a variable preceded with @. For example: *@DATE1.</li> <li>Value is the value you want to set to the variable. For example: 20110601.</li> </ul>	

When the JCL is submitted for execution, the parameter \*@DATE1 (shown in the following example) will be substituted with the value 20110601 in the JCL or in any in-stream data. The example also shows the \*@DATE1 parameter being used in an in-stream data and in a JCL IF statement:

//INPUT DD \*
@DATE1
//AIF IF @DATE1 > 20110101 THEN

If a Universal Controller parameter must be concatenated with a non-space character, end the parameter name with a period (.). The example below uses the \*@DATE1 parameter concatenated with a non-space character in an in-stream data set:

//INPUT DD \*
DATE@DATE1.ACT9898
/\*

# **Skipping Steps during Initial Run**

In a z/OS task, you can specify that one or more steps from the JCL should be skipped when the Controller launches the job. You achieve this by adding SKIPSTNN variables (or parameters) to your z/OS task record.

To configure your z/OS task to skip specific JCL steps:

Step 1	Open the z/OS task.	
Step 2	the Parameters field, click the + icon.	
Step 3	Add a parameter in the following format:	
	<ul> <li>Name = SKIPSTAA (SKIPST is a required string. AA is any combination of alphanumerics used to make this SKIPST command unique. (You can add as many SKIPST commands as needed.)</li> <li>Value = STEPNAME (JCL step name)</li> </ul>	

Step 4

Repeat Steps 2 and 3 for each step you want to skip. Change the AA portion of the SKIPST for each parameter you add. Each Name must be unique.

For example, you could enter parameters:

- SKIPST01, STEP03
- SKIPST02, STEPo5

# **Overriding Key JCL Parameters from Universal Controller**

When you launch a z/OS task from the Controller, you can specify a different Jobname, Jobclass, Msgclass, Schedule ID or add a JOBPARM card. This enables you to run your JCL jobs from the Controller without having to go in and modify your JCL. You can do so by entering new value into the appropriate field in the z/OS Task Details.

# **Disabling Automatic Data Set Deletion**

Universal Automation Center Agent (UAG) will automatically detect and delete data sets that would cause a **NOT CATLGD 2** condition. The data set deletion takes place before the job is started. Starting with UAG 5.1.0.16, automatic data set deletion can be disabled for a z/OS task by defining the OPSDSDEL parameter with a value of NO in the z/OS task definition.

To configure your z/OS task with automatic data set deletion disabled:

Step 1	Open the z/OS task.
Step 2	In the Parameters field, click the + icon.
Step 3	Add a parameter in the following format:
	<ul><li>Name = OPSDSDEL</li><li>Value = NO</li></ul>

The OPSDSDEL parameter accepts a value of YES (the default) or NO.

- A value of YES specifies that automatic data set deletion is enabled for the z/OS task.
- A value of NO specifies that automatic data set deletion is disabled for the z/OS task.

The Re-run Report will indicate if the feature has been disabled.

### Re-running a z/OS Task Instance

When you re-run a z/OS task, you must select job steps in the task to include in the re-run; you cannot simply click a **Re-run** button or **Re-run** in an Action menu, as with other tasks.

The Restartable Job Steps tab in the z/OS Task Instance Details provides a list of all job steps in the task and indicates from which steps you can start the re-run.

When you re-run a z/OS task, the Controller automatically performs the following:

- Deletes data sets that were created in dependent steps.
- Maintains Generation data group.

#### Note

You must re-run a z/OS task from the Universal Controller user interface in order for these clean-up procedures to be performed. Do not re-run the task from the z/OS prompt.

You also can re-run a z/OS task in the In Doubt status (see Re-run a z/OS Task Instance in the In Doubt Status).

### **Confirming JCL Changes**

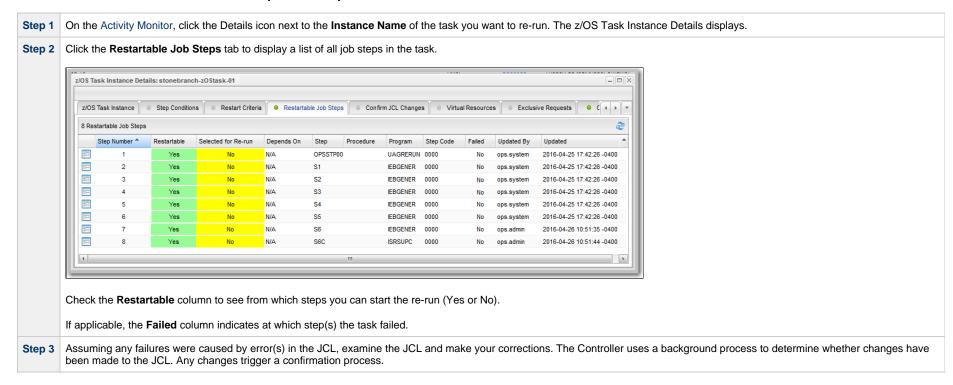

If you make any JCL changes, the Controller will prompt you for a confirmation, as described in Re-run a z/OS Task Instance from a Specific Step, below.

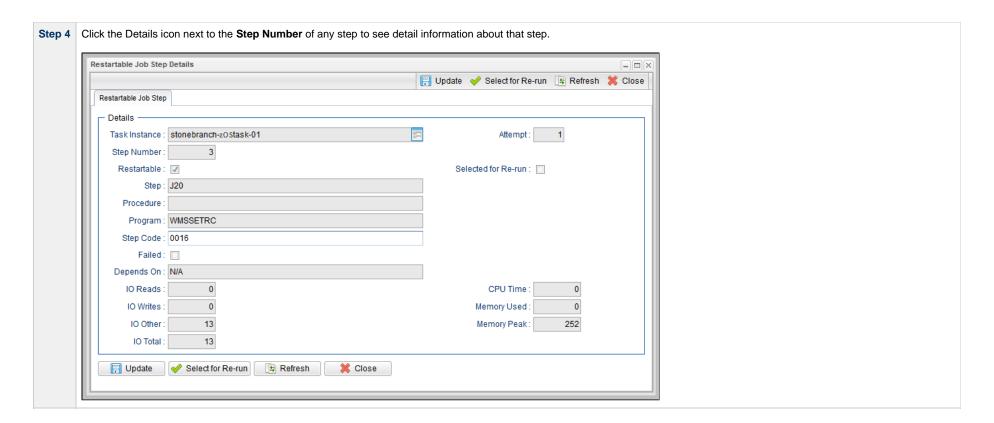

## Re-running a z/OS Task Instance in Start Failure Status

If a z/OS task instance is in Start Failure status, the existence or non-existence of Restartable Job Steps will determine the outcome of a Re-run command.

- If Restartable Job Steps exist, you can re-run the task instance from any steps identified as Restartable under the Restartable Job Steps tab.
- If Restartable Job Steps do not exist, you must re-submit the task instance from the beginning, as when re-running a z/OS task instance from the In Doubt status.

### Re-run a z/OS Task Instance from a Specific Step

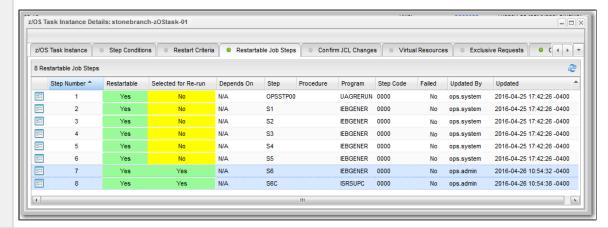

Step 5 From the Restartable Job Steps list, select the steps that you want included in the re-run:

- 1. Click the first step that you want included in the re-run.
- 2. Press and hold the <Shift> key.
- 3. Click the last step that you want included in the re-run.
- 4. Right-click any step in the selected group to display an Action menu.
- 5. Click Select for Re-run.

(You also can right-click a step and select Select to End for Re-run to include that selected step and all following steps in the re-run.)

If you want to de-select a job step in the group for inclusion in the re-run, right-click the step and, in the Action menu, click Deselect for Re-run.

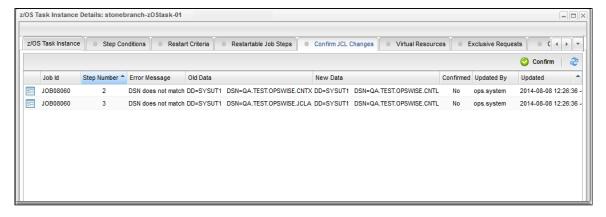

Step 6 Click the z/OS Task Instance tab to redisplay the z/OS Task Instance Details.

**Step 7** Click the **Re-run** button to re-run the task for the selected job steps.

Step 8 If you have made changes to the JCL, the task instance goes into a status of Confirmation Required on the Activity Monitor.

To confirm the changes:

- 1. From the Activity Monitor, open the task instance.
- 2. Click the Confirm JCL Changes tab to display a list of all changes that were made to the JCL:

- 3. Click the Confirm button at the top of the list.
- 4. Click the z/OS Task Instance tab. Verify that the JCL Changes Confirmed field is checked and then click the Re-run button.

Step 9 After the re-run is complete, the Failed column in the Restartable Job Steps list should show No for each step.

#### Note

If you repeat the above process on the same task instance, the previous list of JCL changes, if any, is replaced with the most recent list of changes.

# **Restartable Job Steps List Column Descriptions**

The following table describes each column on the z/OS Restartable Job Steps list.

Column Name	Description
Step Number	Number assigned to this step by the Controller.
Restartable	If the JCL job fails, the Controller determines the latest step that you can restart from. Yes indicates that you can restart from this step.
Selected for Re-run Indicates (Yes or No) whether or not this step has been selected for re-run (the Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled in the Restartable Job Selected for Re-run field is enabled for Re-run field in the Restartable Job Selected for Re-run field is enabled for Re-run field in the Restartable Job Selected for Re-run field fo	
Depends On	Specifies which other step(s), if any, must be completed successfully before you can run this step.
Step	Name of the JCL step (extracted from the JCL).

Procedure	Procedure step name from within the JCL step.	
Program	Name of the program being executed by the step.	
Step Code	Extracted from the JCL. Exit code for this step of the program.	
Failed	Indicates (Yes or No) whether or not this step failed.	
Updated By	Name of the user that last updated this step.	
Updated	Date and time that this step was last updated.	

# **Confirm JCL Changes Tab Column Descriptions**

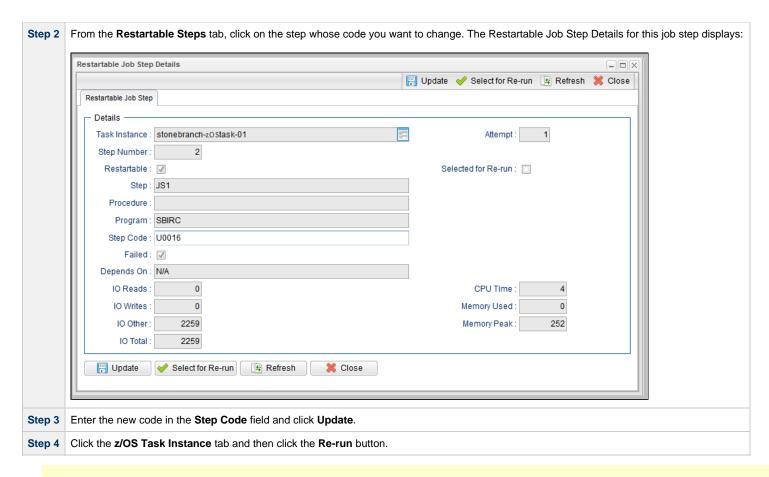

The following table describes each column on the Confirm JCL Changes list.

Column Name	Description
Job Id	Number assigned to this step by the Controller.
Step Number	JCL step number that was modified.
Error Message	Description of the change.
Old Data	JCL before the change.
New Data	JCL after the change.
Confirmed	Indicates (Yes or No) whether or not this JCL change was confirmed.
Updated By	Name of the user that last updated the JCL.
Updated	Date and time that the JCL was last updated.

# **Interactively Ignoring a Step Code to Complete a Task**

If the step code (exit code) on a previous step is causing a step failure, but you still want to finish the job, you can change the step code in order to complete the task.

Step 1 From the Activity Monitor, open the task instance.

 $\triangle$ 

#### Note

By default, on a re-run, the return code in the restarted step will revert to the original return code.

To retain the new step code, change the Retain Overridden Step Codes On z/OS Task Re-run Universal Controller system property to true.

### **CA7/CA11 Toleration**

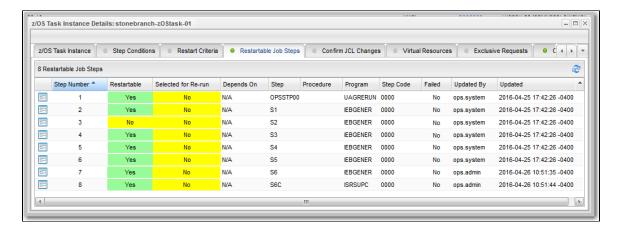

## Non-Restartable Customized Job Steps

The Controller can read and interpret JCL step names that have been customized for CA11 and UCC. This allows you to launch your existing CA11 and UCC jobs from the Controller without modifying the JCL.

When the Controller encounters one of the following step names in your JCL, the Controller will skip the step during a restart:

- CA11NR CA11 Non-Restartable
- UCC11NR UCC11 Non-Restartable
- OPSNR000 Opswise Non-Restartable

In the following example, step 3 has one of the above DD Names and therefore is a non-restartable step.

### SCHID - Overriding the CA7 Schedule ID

The Schedule ID field in the z/OS Task Details allows you to override the CA7 SCHID (Schedule ID).

For example, the JCL shown below contains CA7 Scheduled Overrides statements #JI and #JEND. This JCL will set CLASS = A if the SCHID is between 1 thru 39, and set CLASS=B if the SCHID is between 40 thru 79. The user can set the SCHID by entering it into the Schedule ID field. The Agent scans for #JI and #JEND, and generates the appropriate JCL, as shown in the following example.

```
//SCHID JOB (IMS,001), JIM, MSGCLASS=X, MSGLEVEL=(1,1), NOTIFY=&SYSUID,
#JI,ID=1-39
               CLASS=A
#JEND
#JI, ID=40-79
               CLASS=B
#JEND
//S1
          EXEC PGM=IGWSPZAP
//SYSLIB DD DSN=OPS01.JS01.LOAD, DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSIN
          DD *
DUMPT WMSSETRC WMSSETRC
/*
//
```

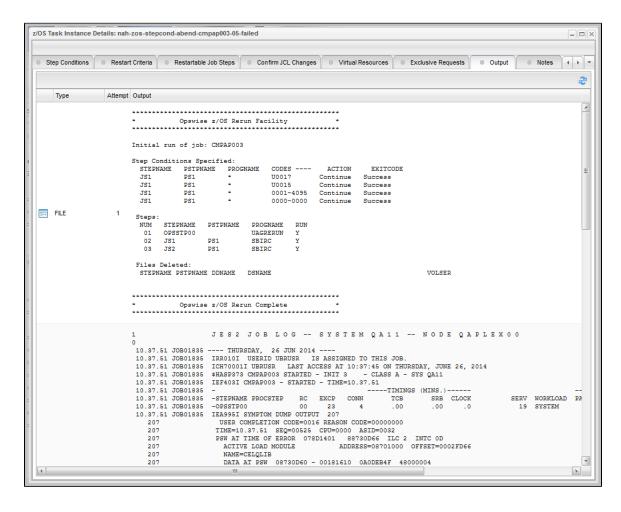

### Non-Restartable Job Steps

A z/OS Agent determines that a job step is non-restartable if the step contains any of the following:

- One of the special DDNAMEs: CA11NR, UCC11NR, or OPSNR000.
- DD statement with DISP=(NEW,PASS) or (OLD,DELETE). (Note that the third DISP value is not considered by the agent.)
- A backwards volume reference. For example: VOL=REF=...

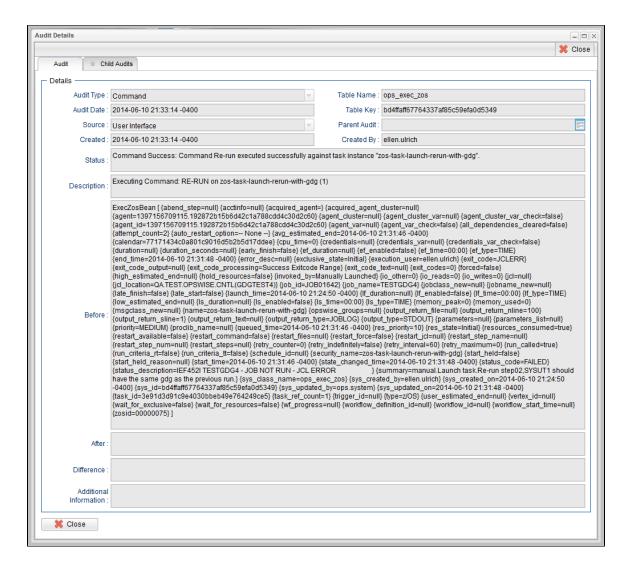

## **Viewing Re-run Reports**

The Controller keeps a detailed record of task re-runs. This data is written to the **Output** tab on the task instance record, as shown in the sample below:

## **Viewing Audit Trails on a Restart**

The Controller maintains detailed audit records on all system activity. The following audit record is for a re-run on a z/OS task.

# **Creating Step Conditions**

- Overview
  - Runtime Monitoring
- Creating a Step Condition
- Step Condition Details Field Descriptions
- Step Condition Logic
- Example Steps and Condition Codes
  - Example Job and Procedure
  - User Interface Specifications and Actions

### Overview

A z/OS JES batch job consists of one or more steps defined by JCL EXEC statements. The JCL EXEC statement identifies the program that the step is to execute. During job execution, steps are executed sequentially under conditions defined by the JCL statements. When a step completes execution, a Step Condition code is recorded by JES. The Step Condition code is either an integer condition code, in the range of 0 - 4095, or an ABEND code. If a step does not execute, which can be for a number of reasons, it is referred to as FLUSH'ed.

A task's status of SUCCESS or FAILED is determined by task exit code processing. The z/OS Task Details Exit Code Processing field specifies the method used to determine the task status for a z/OS batch job. When the **Step Conditions** method is selected, the task status of the z/OS batch job is controlled by the Step Conditions defined in the z/OS Task and parent workflow.

In addition to determining the z/OS Task status, Step Conditions provide a means to control the execution of job steps without any changes to the batch job JCL. A Step Condition definition can specify that job execution is halted, continued, or determined by a console operator. For example, if a multi-step job has a step that ends with a condition code of 8, you could include a Step Condition check to decide whether or not to run the following steps.

Step Conditions can be applied at the z/OS Task level or at the workflow level that apply to all z/OS tasks in that workflow and sub-workflows.

#### Note

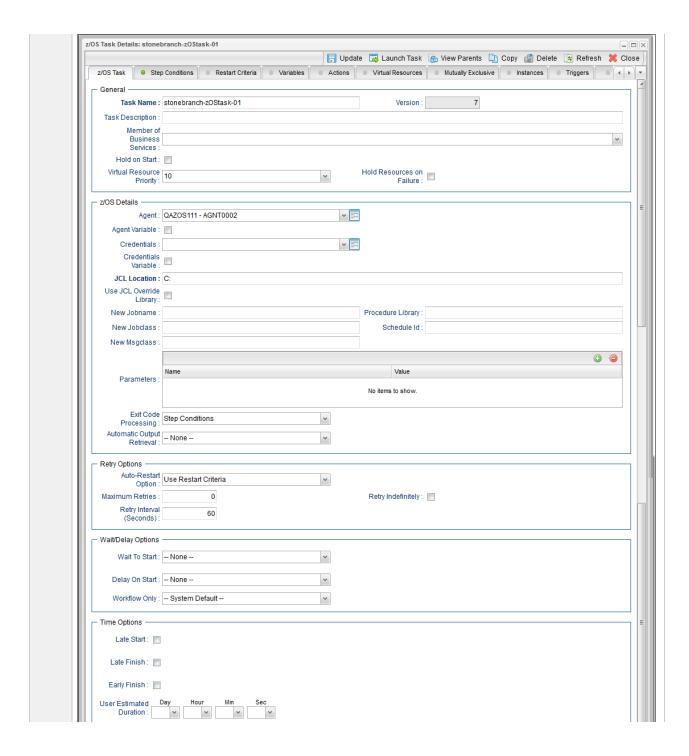

If Step Conditions has been selected for Exit Code Processing, and you then select a different option, a confirmation pop-up displays to warn that any defined Step Conditions will be removed.

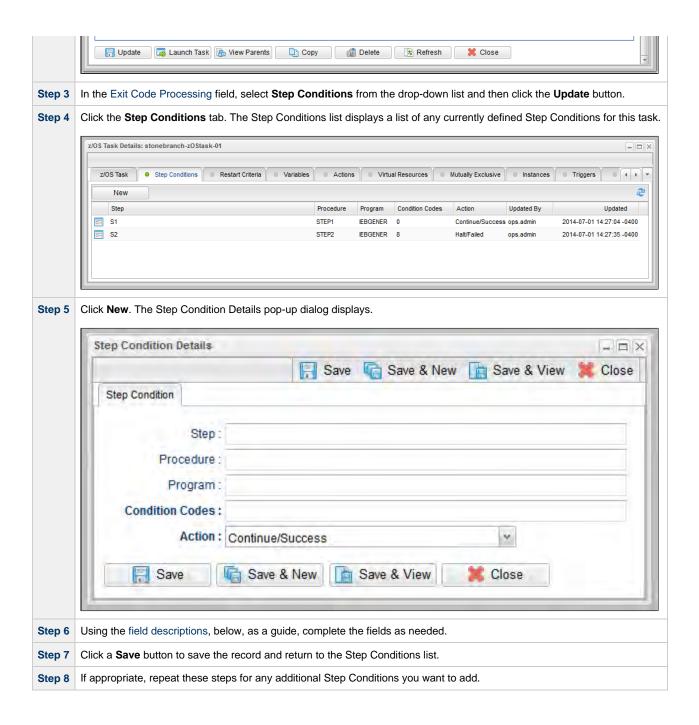

## **Runtime Monitoring**

You can monitor Step Conditions at run time via the Activity Monitor, which lets you add or change Step Conditions for a single task instance and then re-run that job.

## **Creating a Step Condition**

Step 1	From the Automation Center navigation pane, select <b>Tasks &gt; z/OS Tasks</b> . The z/OS Tasks list displays.					
Step 2	Select the task for which you want to create one or more Step Conditions. The z/OS Task Details for that task displays.					

# **Step Condition Details Field Descriptions**

The table below describes the fields and buttons in the Step Conditions Details pop-up dialog.

Field Name	Description					
Step	Job step name to match. A blank value or an asterisk (*) will match any job step name. Generic matching characters asterisk (*) and question mark (?) match zero or more characters and one character, respectively.					
Procedure	Procedure step name to match. A blank value or an asterisk (*) will match any procedure step name. Generic matching characters asterisk (*) and question mark (?) match zero or more characters and one character, respectively.					
Program	Program name to match. A blank value or an asterisk (*) will match any program name. Generic matching characters asterisk (*) and question mark (?) match zero or more characters and one character, respectively.					
	Conditions codes are integer return codes from the program or ABEND codes. Integer return codes are specified as a comma-separated list of integer values or ranges. Ranges are specified with a dash (-) separating the lower and upper bounds of the range. The z/OS job step return code range is 0-4095. ABEND codes are specified directly as either a user ABEND or a system ABEND. The ABEND code must be specified verbatim including leading zeroes.					
	For example: 1,6-4095,Sxxx,Unnnn,JCLERR					
Action	Action to take and the task status to set if the Step Condition matches. See Step Condition Logic, below, for an explanation of the actions.					
Metadata	This section contains Metadata information about this record.					
UUID	Universally Unique Identifier of this record.					
Updated By	Name of the user that last updated this record.					
Updated	Date and time that this record was last updated.					
Created By	Name of the user that created this record.					
Created	Date and time that this record was created.					
Buttons	This section identifies the buttons displayed above and below the Step Condition Details that let you perform various actions.					
Save	Saves a new record in the Controller database.					
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.					
Save & View	Saves a new record in the Controller database and continues to display that record.					
New	Displays empty (except for default values) Details for creating a new record.					
Update button	Saves updates to the record.					
Refresh	Refreshes any dynamic data displayed in the Details.					
Delete button	Deletes the current record.					
Close	For pop-up view only; closes the pop-up view of this task.					

## **Step Condition Logic**

Step Condition exit code processing starts the task with a task status of SUCCESS. As the job executes and steps complete, the task status can change from SUCCESS to FAILED based on Step Condition definitions and job execution conditions. Once a task status has been changed to FAILED, it cannot be changed back to SUCCESS.

#### Note

The Controller searches Step Condition definitions based on their order in the Step Conditions list; the definition at the top of the list is searched first. To change the order of the definitions in the list, drag and drop them to any location.

In addition to Step Condition definitions changing the task status, the following specific job execution conditions will change the task status:

- JCL errors (for examaple, IEFC452I or IEF453I) change the task status to FAILED.
- A job step ABEND that does not match any Step Condition definition changes the task status to FAILED.

As job steps complete execution, Universal Controller searches the list of task-level Step Condition definitions that matches the current step based on the job step name, procedure step name, program name, and the Step Condition code. The search stops when the first definition is found. If a matching Step Condition is found, the Step Condition action is taken. If no matching task-level Step Condition is found, the search continues with the parent workflow-level Step Conditions. If no matching workflow-level Step Conditions and so on until a match is found or all Step Conditions have been search in the hierarchy. If no matching Step Condition is found, the Controller takes no action and normal JES processing of the job continues.

#### Note

If a step does not execute, no search is performed for that step in the Step Condition definitions. For example, if a job step FLUSH'es due to a JCL IF statement, the Step Conditions will not be search for the step.

The Step Condition definition action value specifies two attributes, the action to take and the task status. These two attributes are combined into combinations that form the possible action values. The following Step Condition actions are supported:

Continue/Success	Job execution continues and task status is set to SUCCESS.				
Continue/Failed	Job execution continues and task status is set to FAILED.				
Halt/Failed	Job execution is halted at the current step and task status is set to FAILED.				
Askoper	Job execution is stopped and the Controller sends a WTOR message to the console operator requesting a reply on how job execution should proceed. The action is dependent upon the operator reply (see Example 4, below).				

During job processing, the Controller issues message UAG1059A to the job log when it matches a Step Condition definition to a step that has completed execution. Message UAG1059A includes the Step Condition definition values including the action that is taken. The message provides an audit record of Step Condition processing that has influenced job execution.

## **Example Steps and Condition Codes**

This section provides a sample job and PROC, followed by example condition code checks for that job.

## **Example Job and Procedure**

### **Example Job**

```
//JOBA JOB ...
//S1 EXEC ACCTBL10
```

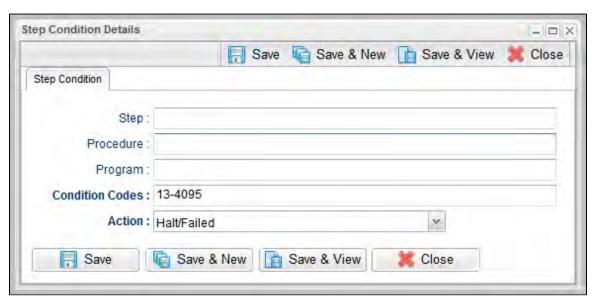

### **Example Procedure (Cataloged Procedure)**

```
//ACCTBL10 PROC
//STEP1 EXEC PGM=BALANCE
//STEP2 EXEC PGM=MERGE
//STEP3 EXEC PGM=IEBGENER
// PEND
```

### **User Interface Specifications and Actions**

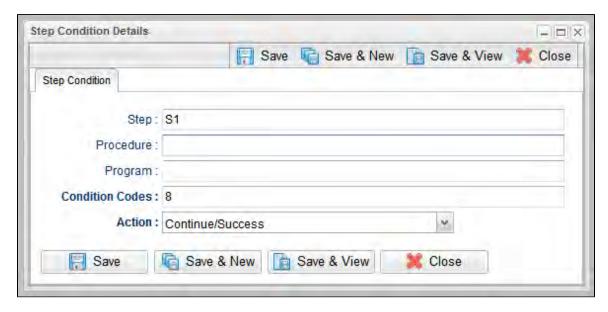

The following examples specify condition code checks for the example job above.

### Example 1

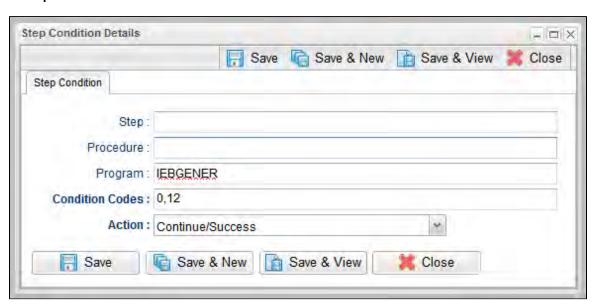

In this example, if the condition code of any step of the job is greater than 12, the job halts and the task status is set to FAILED.

### Example 2

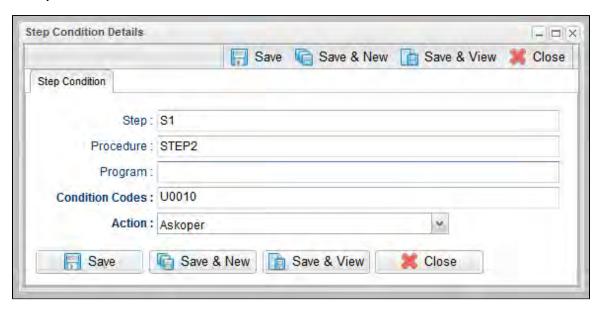

In this example, if the condition code of any procedure step executed as job step S1 is equal to 8, the job continues and the task status is set to SUCCESS.

### Example 3

In this example, if the condition code of program IEBGENER is 0 or 12, the job continues and the task status is set to SUCCESS.

### Example 4

In this example, if the condition code from job step S1, procedure step STEP2 is user ABEND U0010, the operator is alerted with a WTOR console message that specifies the job name, the job step, the procedure step, and the actual condition code. The Controller will take the action specified by the operator reply.

### **Issued WTOR**

```
UAG1058A JOBA ,S1 ,STEP2 ,Code: U0010 Reply 1:CONT/SUCCESS, 2:CONT/FAIL, 3:HALT/FAIL
```

The UAG1058A WTOR message identifies the job name as JOBA, step name as S1, procedure step name as STEP2, and the Step Condition code as U0010 that matched the Step Condition definition which resulted in the ASKOPER action.

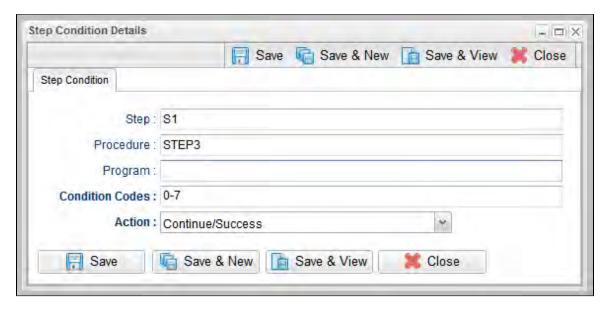

### **Operator Reply**

The operator must reply with one of the following:

- (1) CONTINUE/SUCCESS
- (2) CONTINUE/FAILED
- (3) HALT/FAILED

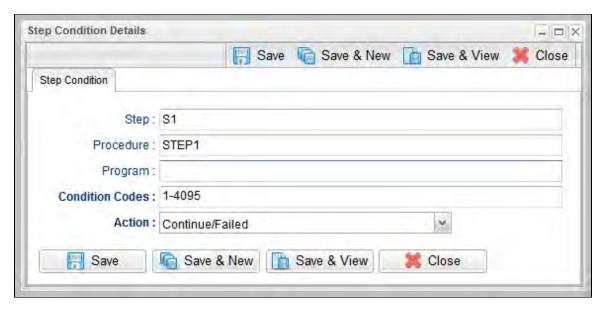

(See Step Condition Logic for an explanation of these replies.)

### Example 5

In this example, if the condition code from job step S1, procedure step STEP3 is within the range of 0-7, the job continues and the task status is set to SUCCESS.

### Example 6

In this example, if the condition code from job step S1, procedure step STEP1 is greater than 0, the job continues and the task status is set to FAILED.

# **Creating Step Actions**

- Overview
- Creating a Step Action
- System Operation Step Action Field Descriptions

### Overview

You can specify actions to take on z/OS tasks in a Workflow based on step condition codes returned for any of the steps in that z/OS task.

#### Note

Currently, the only step action that you can take on z/OS tasks in a workflow is a System Operation.

Step actions can be defined only at the Workflow level. They apply to one, more, or all z/OS tasks in that immediate Workflow; they do not apply to any z/OS tasks in sub-workflows. (Every task in a Workflow has a unique Vertex ID, which is how you can tell one task from another if the Workflow has more than one of the exact same task.)

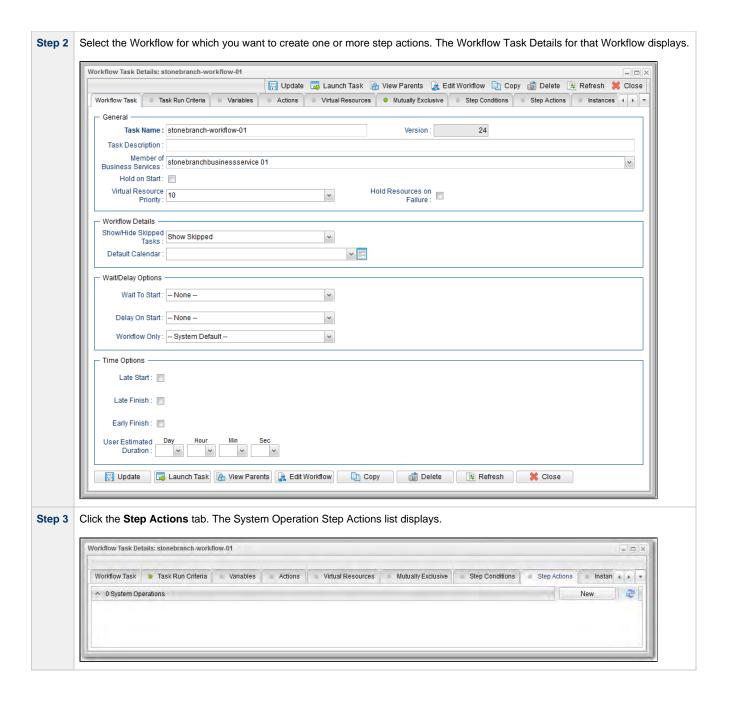

When you create a step action for a task in the Workflow, you specify the name of the task in the Task field. If there is more than one of those tasks in the Workflow, the Vertex Id drop-down list shows the Vertex Id for all tasks. So you can apply the step action to all tasks of that name in the Workflow or just the task with that Vertex Id.

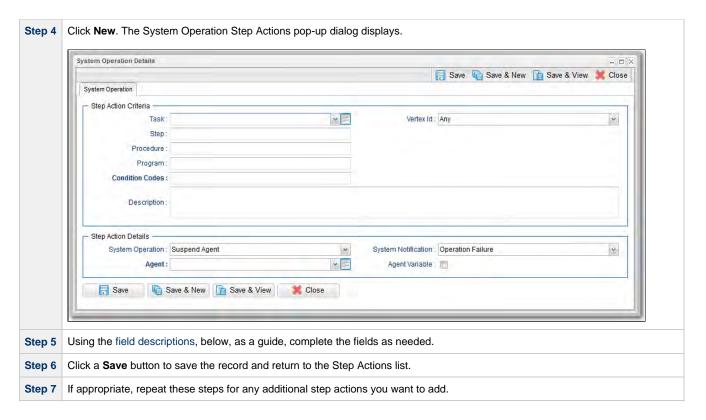

In the Workflow Editor, when you right-click a task, there's a View/Edit Run Criteria selection for every task. For z/OS tasks, there's also a View/Edit z/OS Step Actions selection.

Every z/OS task is comprised of one or more steps. Each step in a z/OS task ends in a step condition code. System Operation step actions optionally let you send system notifications based on the outcome of each step action with options for None, Operation Failure, Operation Success/Failure, and Operation Success.

## **Creating a Step Action**

Step 1 From the Automation Center navigation pane, select Tasks > Workflow Tasks. The Workflow Tasks list displays.

## **System Operation Step Action Field Descriptions**

The following table describes the fields and buttons in the System Operation Step Action Details.

Field Name	Description					
Step Action Criteria	This section contains criteria for performing the step action.					
Task	lame of a task. In combination with the Vertex Id, it specifies a specific task within the Workflow to which the step action applies; if no task is specified, the step action pplies to all z/OS tasks within the Workflow.					
Vertex Id	Numerical ID of the task that identifies it uniquely from other tasks of the same type in the Workflow. In combination with the Task, it specifies a specific task within the Workflow to which the step action applies.					
	Options:					
	<ul> <li>Any - The action applies to any instance of the specified task in the Workflow.</li> <li><number> - The action applies only to this instance of the task in the Workflow.</number></li> </ul>					

Step	Job step name to match. A blank value or an asterisk (*) will match any job step name. Generic matching characters asterisk (*) and question mark (?) match zero or more characters and one character, respectively.						
Procedure	Procedure step name to match. A blank value or an asterisk (*) will match any procedure step name. Generic matching characters asterisk (*) and question mark (?) match zero or more characters and one character, respectively.						
Program	Program name to match. A blank value or an asterisk (*) will match any program name. Generic matching characters asterisk (*) and question mark (?) match zero or more characters and one character, respectively.						
Condition Codes	Conditions codes are integer return codes from the program or ABEND codes. Integer return codes are specified as a comma-separated list of integer values or ranges. Ranges are specified with a dash (-) separating the lower and upper bounds of the range. The z/OS job step return code range is 0-4095. ABEND codes are specified directly as either a user ABEND or a system ABEND. The ABEND code must be specified verbatim including leading zeroes.						
Description	Description of this System Operation Step Action.						
Step Action Details	This section contains assorted detailed information about the step action.						
System Operation	Specific system operation to perform.						
	Options:						
	<ul> <li>Suspend Agent</li> <li>Resume Agent Cluster</li> <li>Resume Agent Cluster</li> <li>Suspend Cluster Membership</li> <li>Resume Cluster Membership</li> <li>Resume Cluster Task Execution Limit</li> <li>Set Cluster Task Execution Limit</li> <li>Set Virtual Resource Limit</li> <li>Run Task Instance Command</li> <li>Launch Task</li> <li>Trigger Now</li> </ul>						
	Note For the Suspend Agent and Resume Agent operations, the user must have the following Agent permissions:  • Explicit Read permission, if the Strict Business Service Membership Read Constraints Universal Controller system property is true. • Suspend Agent and Resume Agent commands permission.						
	For the Suspend Agent Cluster, Resume Agent Cluster, Suspend Agent Cluster Membership, and Resume Agent Cluster Membership operations, the user must have the following Agent Cluster permissions:						
	<ul> <li>Explicit Read permission, if the Strict Business Service Membership Read Constraints Universal Controller system property is true.</li> <li>Suspend Agent, Resume Agent, Suspend Agent Membership, and Resume Agent Membership commands permission.</li> </ul>						
	·						

System Notification	Status of the specified system operation that will trigger a system notification.							
	Options:      None     Operation Failure (default)     Operation Success/Failure     Operation Success							
	Note The Controller must be configured for system notifications in order for system notifications to be triggered.							
Agent	If System Operation is Suspend Agent, Resume Agent, Suspend Cluster Membership, Resume Cluster Membership, or Set Agent Task Execution Limit; Agent for which the system operation is to be performed.							
Agent Variable	If System Operation is Suspend Agent, Resume Agent, Suspend Cluster Membership, Resume Cluster Membership, or Set Agent Task Execution Limit; Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked).							
Agent Cluster	If System Operation is Suspend Agent Cluster, Resume Agent Cluster, Suspend Cluster Membership, Resume Cluster Membership, or Set Cluster Task Execution Limit; Agent Cluster for which the system operation is to be performed.							
Agent Cluster Variable	If System Operation is Suspend Agent Cluster, Resume Agent Cluster, Suspend Cluster Membership, Resume Cluster Membership, or Set Cluster Task Execution Limit; Indication of whether the Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Agent Cluster as a variable (checked).							
Task Execution Limit	If System Operation is <b>Set Agent Task Execution Limit</b> or <b>Set Cluster Task Execution Limit</b> ; Specification for whether a Limited or Unlimited number of task instances can be run concurrently on the specified Agent / Agent Cluster. (Default is Unlimited.)							
Virtual Resource	If System Operation is Set Virtual Resource Limit; Virtual resource for which a virtual resource limit is to be set.							
	Note If the Strict Business Service Membership Read Constraints Universal Controller system property is true, the drop-down list displays only Virtual Resources for which the user has explicit Read permission.							
Virtual Resource Variable	If System Operation is <b>Set Virtual Resource Limit</b> ; Indication of whether the <b>Virtual Resource</b> field is a reference field for selecting a specific Virtual Resource (unchecked) or a text field for specifying the <b>Virtual Resource</b> as a variable (checked).							
Limit	If System Operation is <b>Set Agent Task Execution Limit</b> or <b>Set Cluster Task Execution Limit</b> , and Task Execution Limit is <b>Limited</b> ; Number of tasks that can be run concurrently by the specified Agent / Agent Cluster.							
	If System Operation is Set Virtual Resource Limit; Virtual resource limit to be set for the specified virtual resource.							

Command	If System Operation is <b>Run Task Instance Command</b> ; Type of task instance command to run.						
	Options:						
	<ul> <li>Cancel</li> <li>Force Finish</li> <li>Force Finish (Halt)</li> <li>Force Finish/Cancel</li> <li>Force Finish/Cancel (Halt)</li> <li>Skip</li> <li>Unskip</li> <li>Hold</li> <li>Release</li> <li>Release Recursive</li> <li>Clear All Dependencies</li> <li>Clear Exclusive</li> <li>Clear Resources</li> <li>Clear Resources</li> <li>Clear Timewait</li> <li>Re-run</li> </ul>						
Instance Lookup Option	If System Operation is Run Task Instance Command; Specification for how to search for the task instance to run a command against.  Options:  Instance Name Instance Name/Task Instance Id Task						
Instance Name	If Instance Lookup Option is Instance Name or Instance Name/Task; Name of the task instance to run the command against.						
Instance Criteria	If Instance Lookup Option is Instance Name, Instance Name/Task, or Task; Additional criteria for selecting a specific task instance if multiple task instances have matching names.  • Newest Active Instance • Oldest Active Instance • Newest Instance • Oldest Instance • Oldest Instance (An Active task instance is an instance that is not in any of these statuses: Skipped, Finished, Success.)						
	Note An Unskip command can use only the Newest Instance and Oldest Instance criteria; an active instance cannot be unskipped.						
Task Reference	<ul> <li>If Instance Lookup Option is Instance Name/Task or Task; Name of the task for which the task instance was run.</li> <li>If System Operation is Launch Task; Name of the task to launch.</li> </ul>						

Task Reference Variable	If Instance Lookup Option is <b>Instance Name/Task</b> or <b>Task</b> , or if System Operation is Launch Task; Indication of whether the <b>Task Reference</b> field is a reference field for selecting a specific Task (unchecked) or is a text field for specifying the task as a variable (checked). For a variable, use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.							
Instance ID	If Instance Lookup Option is Instance ID; ID of task instance to run the command against. The instance ID (sysid) is a 32-character universally unique identifier. You can use the \${ops_task_id} variable or \${_siblingid('mytask')} function to get the instance id.							
Trigger Reference	If System Operation is Trigger Now; Name of the trigger.							
Trigger Reference Variable	f System Operation is Trigger Now; Indication of whether the <b>Trigger Reference</b> field is a reference field for selecting a specific Trigger (unchecked) or is a text field for specifying the trigger as a variable (checked). For a variable, use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.							
Override Variables	If System Operation is Launch Task or Trigger Now; Variables to override.							
Override Variables Resolution Disabled	If System Operation is Launch Task or Trigger Now; Indication of whether or not Override Variables resolution should be disabled to allow for passing unresolved variable values.							
	<ul> <li>If enabled (checked), Override Variables will be left unresolved. Any unresolved variables will be resolved in the context of the launched or triggered task instance.</li> <li>If disabled (unchecked), Override Variables will be resolved prior to the execution of the Launch Task or Trigger Now System Operation.</li> </ul>							
Workflow Instance Name Condition	If System Operation is Run Task Instance Command; Optional. Type of condition for the name of the parent workflow task instance that contains the task on which to perform the specified action.							
	The action will be performed only on a task instance in a parent workflow task instance meeting the specified condition value.							
	Options:							
	<ul> <li>Equals</li> <li>Starts With</li> <li>Contains</li> <li>Ends With</li> </ul>							
	For the selected condition (the default is Equals), a corresponding field displays (see below) that allows you to enter a value for that condition.							
Workflow Instance Name Equals	If Workflow Instance Name Condition = Equals; Exact name of a parent workflow task instance containing the task. Variables are supported.							
Workflow Instance Name Starts With	If Workflow Instance Name Condition = Starts With; Character string at the start of the name of a parent workflow task instance containing the task. Variables are supported.							
Workflow Instance Name Contains	If Workflow Instance Name Condition = Contains; Character string in the name of a parent workflow task instance containing the task. Variables are supported.							
Workflow Instance Name Ends With	If Workflow Instance Name Condition = Ends With; Character string at the end of the name of a parent workflow task instance containing the task. Variables are supported							
Metadata	This section contains Metadata information about this record.							
UUID	Universally Unique Identifier of this record.							
Updated By	Name of the user that last updated this record.							
Updated	Date and time that this record was last updated.							

Created By	Name of the user that created this record.					
Created	Date and time that this record was created.					
Buttons	This section identifies the buttons displayed above and below the Step Action Details that let you perform various actions.					
Save	Saves the new System Operation Step Action Details record in the Controller database.					
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.					
Save & View	Saves a new record in the Controller database and continues to display that record.					
Update	Saves updates to the record.					
Refresh	Refreshes any dynamic data displayed in the Details.					
Delete	Deletes the current record.					
Close	For pop-up view only; closes the pop-up view of this task.					

# **Creating Restart Criteria**

- Overview
- Creating Restart Criteria
- Restart Criteria Field Descriptions
- Restart Criteria Logic
- · Restart Criteria Details Directives

### Overview

A z/OS JES batch job consists of one or more steps defined by JCL EXEC statements. The JCL EXEC statement identifies the program that the step is to execute. During job execution, steps are executed sequentially under conditions defined by the JCL statements.

When a task ends in a failed state, some or all of the job steps may need to be re-run. The set of steps that should be re-run (if any) may vary depending on how and where the task failed. If the task is defined with Auto-Restart Option = **Use Restart Criteria**, the Restart Criteria is used to select the appropriate steps to restart based on a particular failure scenario.

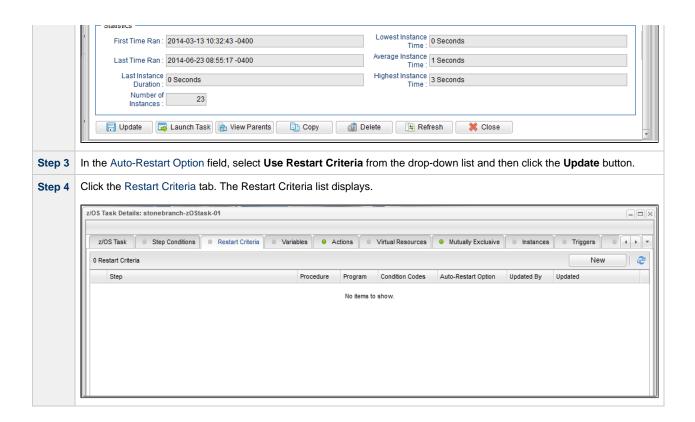

#### Note

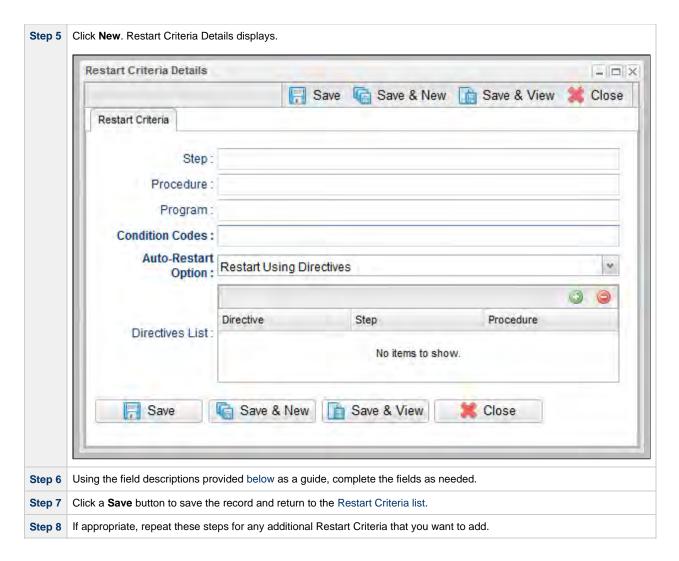

If Use Restart Criteria has been selected for Auto-Restart Option, and you then select a different option, a confirmation pop-up displays to warn that any defined Restart Criteria will be removed.

## **Creating Restart Criteria**

Step 1	From the Automation Center navigation pane, select <b>Tasks &gt; z/OS Tasks</b> . The z/OS Tasks list displays.						
Step 2	Select the task for which you want to create one or more Restart Criteria. The z/OS Task Details for that task displays.

# **Restart Criteria Field Descriptions**

The following table describes the fields and buttons in the Restart Criteria Details.

Field Name	Description
Step	Job step name to match. A blank value or an asterisk (*) will match any job step name. Generic matching characters asterisk (*) and question mark (?) match zero or more characters and one character, respectively.

Procedure	Procedure step name to match. A blank value or an asterisk (*) will match any procedure step name. Generic matching characters asterisk (*) and question mark (?) match zero or more characters and one character, respectively.
Program	Program name to match. A blank value or an asterisk (*) will match any program name. Generic matching characters asterisk (*) and question mark (?) match zero or more characters and one character, respectively.
Condition Codes	Conditions codes are integer return codes from the program or ABEND codes. Integer return codes are specified as a comma-separated list of integer values or ranges. Ranges are specified with a dash ( - ) separating the lower and upper bounds of the range. The z/OS job step return code range is 0-4095. ABEND codes are specified directly as either a user ABEND or a system ABEND. The ABEND code must be specified verbatim including leading zeroes.
	For example: 1,6-4095,Sxxx,Unnnn,JCLERR
Auto-Restart Option	Method of step selection to perform for the restart. See Restart Criteria Logic, below, for an explanation of the options.
Directives List	(See Restart Criteria Details - Directives, below.)
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.

Save	Saves a new record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
Update	Saves updates to the record.
Delete	Deletes the current record.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this record.

# **Restart Criteria Logic**

Restart Criteria are processed when a task transitions to a Failed status, provided that:

- Auto-Restart Option = Use Restart Criteria.
- Maximum Retries = greater than zero.

When Restart Criteria processing begins, the Controller will search the list of Restart Criteria definitions to find a match for the current failure scenario. Matching is based on job step name, procedure step name, program name, and the step condition code. The search stops when the first definition is found. If a matching Restart Criteria is found, the Auto-Restart Option for that Restart Criteria is performed. If no matching Restart Criteria is found, the Controller takes no action and no job steps will be selected for restart.

#### Note

The Controller searches Restart Criteria definitions based on their order in the Restart Criteria list; the definition at the top of the list is searched first. To change the order of the definitions in the list, drag and drop them to any location.

The Restart Criteria Details Auto-Restart Option specifies how steps will be selected for restart.

The following Auto-Restart Options are supported:

Restart From First Job Step	All restartable job steps, from first to last, will be selected for restart.				
Restart From Matching Job Step	All restartable job steps, from the step that matched the Restart Criteria to the last job step, will be selected for restart.				
Restart Using Directives	Job steps will be selected for restart based on the directives specified in the Restart Criteria directive table.				

### **Restart Criteria Details - Directives**

The following table describes the fields and button in the Directives section of the Restart Criteria Details.

Field Name	Description
Directive	Specifies a directive for step selection.
	Options:
	<ul> <li>Start - Directive used to specify the starting step in a range of steps selected for restart. The directive table can contain zero or one Start directives. If a start directive is not specified, the first job step will be used as the starting step.</li> <li>Skip - Directive used to specify a step that should be skipped. Skipped steps will not be restarted. The directive table can contain zero or more Skip directives.</li> <li>End - Directive used to specify the ending step in a range of steps that will be selected for restart. The directive table can contain zero or one End directives. If an end directive is not specified, the last job step will be used as the ending job step.</li> </ul>

Step	The directive step optionally specifies:
	1. A relative step number. Relative step numbers begin with + or -, followed by some number of steps to offset from the step matched by the Restart Criteria. A value of -0 or +0 indicated that the directive is referring to the job step that matched the Restart Criteria.
	Relative step numbers are mutually exclusive with the Procedure field.
	If a relative step number is specified, no matching is performed. The directive will apply to an explicit offset from the job step that matched the Restart Criteria definition.  2. The job step name to match. A blank value or an asterisk (*) will match any job step name. Generic matching characters asterisk (*) and question mark (?) match zero or more characters and one character, respectively.
Procedure	The procedure step name to match. A blank value or an asterisk (*) will match any procedure step name. Generic matching characters asterisk (*) and question mark (?) match zero or more characters and one character, respectively.
Add button	Adds the directive defined by the fields above to the directive table.

## **Universal Command Task**

- Before You Begin
- Built-In Variables
- Creating a Universal Command Task
  - Universal Command Task Details
  - Universal Command Task Details Field Descriptions
- Viewing a Universal Command Task Instance
  - Universal Command Task Instance Details
  - Universal Command Task Instance Details Field Descriptions
- Output Redirection
- Running a Universal Command Task
- Monitoring Task Execution

# **Before You Begin**

The Universal Command task allows you to run a platform-specific application on a machine where Universal Agent is running. Universal Command is functionality provided by the Agent that serves as an agent process. Universal Command runs on any supported platform: z/OS, Linux/Unix, and Windows.

To run a Universal Command task, you must first complete the following:

- Install an Agent on the target machine.
- · Launch the Agent. When the Agent connects with the Controller, it automatically creates an Agent resource definition in the Controller database.

#### Note

If you are running multiple **ubroker** started tasks and want to run a Universal Command task on a specific **ubroker**, you must specify the service port number associated with that **ubroker** in the Universal Command Options field on the Universal Command Task Details. The syntax is **-port nnnn**.

## **Built-In Variables**

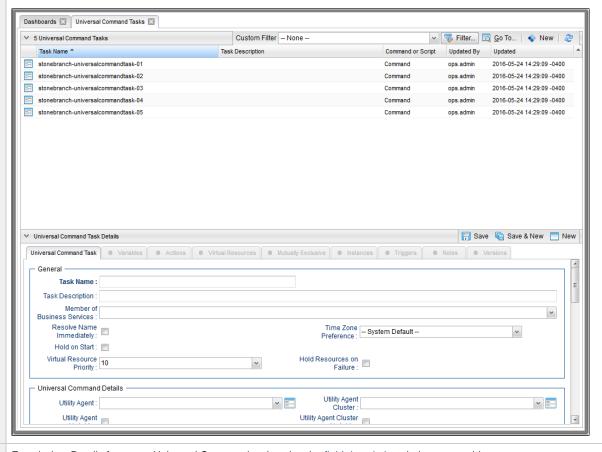

The following built-in variables can be used in a Universal Command task to pass data where appropriate:

- Agent-Based Task Instance variables
- Task Instance variables

# **Creating a Universal Command Task**

Step 1 From the Automation Center navigation pane, select Tasks > Universal Command Tasks. The Universal Command Tasks list displays a list of all currently defined Universal Command tasks.

Below the list, Universal Command Task Details for a new Universal Command task displays.

- Step 2 | Enter/select Details for a new Universal Command task, using the field descriptions below as a guide.
  - Required fields display in **boldface**.
  - Default values for fields, if available, display automatically.

To display more of the Details fields on the screen, you can either:

- Use the scroll bar.
- Temporarily hide the list above the Details.
- Click the New button above the list to display a pop-up version of the Details.

Step 3 Click a Save button. The task is added to the database, and all buttons and tabs in the Task Details are enabled.

#### Note

To open an existing record on the list, either:

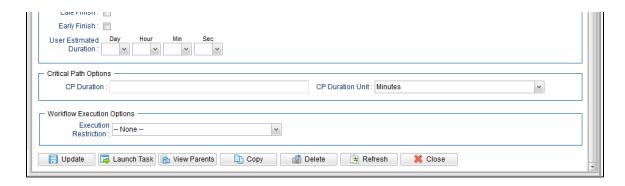

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click **Open In Tab** in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

## **Universal Command Task Details**

The following Universal Command Task Details is for an existing Universal Command task.

Depending on the values that you enter / select for these fields, and whether or not the Universal Command task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the Universal Command Task Details.

# **Universal Command Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the Universal Command Task Details.

Field Name	Description
General	This section contains general information about the task.
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.

Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.							
	Options:							
	System Default –  Till to be a death of the Tools Till to be a first on the site of the tools of							
	Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.  • Server (xxx)							
	Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.  • Inherited							
	Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.							
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.							
Hold Reason	Information about why the task will be put on hold when it starts.							
Virtual Resource	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.							
Priority	Options: 1 (high) - 20 (low).							
	Default is 10.							
Hold								
Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.							
Universal Command	This section contains assorted detailed information about the task.							
Details								
Utility Agent	Name of the Windows or Linux/Unix Agent resource that will communicate with the Universal Command Agent. If you do not specify an Agent, you must specify an agent cluster.							
Utility Agent Variable	If enabled, the Utility Agent field converts from a reference field (where you browse and select a record) into a text field that allows you to enter a variable. Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.							
	Note When updating multiple Tasks, to change from using a Utility Agent reference to using a Utility Agent variable, you must change the Utility Agent Variable field to Yes and specify the Utility Agent variable in the Utility Agent Unresolved field. Conversely, to change from using a Utility Agent variable to using a Utility Agent reference, you must change the Utility Agent Variable field to No and specify the Utility Agent reference in the Utility Agent field.							
	+							

#### Utility Agent Cluster

Group of Agents, one of which the Controller will choose to run this task. You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific Agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.

#### Utility Agent Cluster Variable

Indication of whether the Utility Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Utility Agent Cluster as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Utility Agent Cluster reference to using a Utility Agent Cluster variable, you must change the **Utility Agent** Cluster Variable field to **Yes** and specify the Utility Agent Cluster variable in the **Utility Agent Cluster Unresolved** field. Conversely, to change from using a Utility Agent Cluster variable to using a Utility Agent Cluster reference, you must change the **Utility Agent Cluster Variable** field to **No** and specify the Utility Agent Cluster reference in the **Utility Agent Cluster** field.

#### Utility Credentials

Login credentials that the Agent will use to access the Universal Command server machine.

Required if the Agent Credentials Required Universal Controller system property is true.

#### Utility Credentials Variable

Indication of whether the Utility Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Utility Credentials as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Utility Credentials reference to using a Utility Credentials variable, you must change the **Utility Credentials Variable** field to **Yes** and specify the Utility Credentials variable in the **Utility Credentials Unresolved** field. Conversely, to change from using a Utility Credentials variable to using a Utility Credentials variable field to **No** and specify the Utility Credentials reference in the **Utility Credentials** field.

### UCMD Agent

Depending on the value in the UCMD Agent Option field, this field contains either:

- Record name from the UCMD Agent table.
- Variable that will be resolved when the task is launched.
- Host name of a machine where the UCMD Agent is running.

UCMD Agent Option	Specifies how the name of the UCMD Agent is being supplied in the UCMD Agent field.  Options:  UCMD Agent - UCMD Agent record is selected from the UCMD Agent table.  UCMD Agent Variable - UCMD Agent field contains a variable that will be resolved when the task is launched.  UCMD Agent Hostname - UCMD Agent field contains the host name where the UCMD Agent is running. The host name must be accessible by the Controller.
UCMD Credentials	Login credentials that Controller will use to access the remote machine where the UCMD Agent is running.
UCMD Credentials Variable	Indication of whether the UCMD Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the UCMD Credentials as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using a UCMD Credentials reference to using a UCMD Credentials variable, you must change the UCMD Credentials Variable field to Yes and specify the UCMD Credentials variable in the UCMD Credentials Unresolved field. Conversely, to change from using a UCMD Credentials variable to using a UCMD Credentials reference, you must change the UCMD Credentials Variable field to No and specify the UCMD Credentials reference in the UCMD Credentials field.
Command or Script	Specifies whether a single command or a script is being executed.  Options:  Command (default) Script
Command	Required if Command or Script = Command; Command being executed on the remote machine. Variables supported.
Script File	Required if Command or Script = Script; Path and filename of the script file that will be executed on the remote machine.
Script Options	If Command or Script = Script; Optional. One or more command line options to pass to the script file.
UCMD Options	Any UCMD options needed by the program to execute properly. Variables supported.
Runtime Directory	Directory from which the application should be executed. Variables supported.

Exit Code Processing	Specifies how the Controller should determine whether the executed command failed or completed successfully.
	Options:
	<ul> <li>Success Exitcode Range         Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field.</li> <li>Failure Exitcode Range</li> </ul>
	Command is considered failed if its exit code falls within the range specified in the Exit Codes field.  • Success Output Contains  Command is considered completed successfully if its output contains the text specified in the Scan Output For field.
	Failure Output Contains
	Command is considered failed if its output contains the text specified in the Scan Output For field.  • Step Conditions (z/OS only)
	Command is considered completed successfully/failed if any of its specified condition codes falls within the range specified under the Step Conditions tab (see Creating Step Conditions).
Output Type	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output.
	Options:
	<ul> <li>Standard Output (STDOUT)</li> <li>Standard Error (STDERR)</li> <li>File</li> </ul>
Scan Output For	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this field as a regular expression.
Output File (for Exit Code Processing)	Required if Output Type = File; path and file name of the output file that should be scanned for the text in the Scan Output For field.
Exit Codes	Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.

### Automatic Output Retrieval

Specifies whether you want the Controller to automatically retrieve any output from the job and attach it to the task instance record.

### Options:

- None
- Do not attach any output to the task instance record.
- Standard Output
  - Attach all standard output.
- Standard Error
  - Attach standard error output.
- File
  - Attach the file specified in the Output File field.
- Standard Output/Error

Attach all standard output and standard error output.

#### Note

Tasks specifying Automatic Output Retrieval will fail with Start Failure if the Agent Output Prohibited field is true in the Details of the specified Agent.

### Start Line

If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Instructs the Controller to retrieve data beginning at the line indicated.

- If a **Start Line** value is not specified, the default is 1.
- If the **Start Line** value is **-1**, data will be retrieved starting at the end of the file.

# Number of Lines

If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Allows you to limit the retrieved data to the number of lines specified. If a Number of Lines value is not specified, the default is the value of the Retrieve Output Default Number Of Lines Universal Controller system property.

### Scan Text

If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Regex pattern that the Controller will search for a match for in STDOUT/STDERR or a specified file. The Controller will include the **Number of Lines** above and below the first line matched.

if the Regex pattern is not found, the following message is returned: OPSWISE WARNING - Scan text string not found.

### Output File (for Automatic Output

Required if Automatic Output Retrieval = File; path and file name containing the output that you want automatically retrieved and attached to the task instance.

### Retry Options

Retrieval)

This section contains specifications for retrying the task.

### Retry Exit Codes

Exit code range for which an auto-retry of tasks in FAILED status will occur. Exit code ranges must be in the same format as ranges specified in the Exit Codes field. Maximum Retries must be greater than 0.

If this field is empty, any exit code potentially will cause a retry.

Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval (Seconds)	User-defined; number of seconds between each retry.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:
	All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.
	<ul> <li>Workflow conditional path processing; any Successors waiting on a failure path will not be released.</li> </ul>
	• Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which <b>Suppress Intermediate Failures</b> has been enabled.
	Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	<ul> <li>None –</li> <li>Time</li> <li>Relative Time</li> <li>Duration</li> <li>Seconds</li> </ul>
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

## Wait Day Constraint If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day. Valid values: -- None --• If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. Same Day Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Default is - None --. Wait If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task. Duration Wait Duration In If Wait To Start = Seconds; Number of seconds to wait before starting the task. Seconds Delay On Start Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified. Options are: None – Duration Seconds

Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  Options are:  System Default Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.)  Yes Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  No Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

## Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Dav Advance to a specific number of days in the future. Default is - None --. Late Start Nth Amount If Late Start Day Constraint = Nth Day; Number of days to advance. Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Late Finish Type	Required if Late Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:
	<ul> <li> None Advance to the next day if the specified late finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> </ul>
	<ul> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul> Default is - None
	Dotault is Notice.
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.
Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.

Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  • None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.

Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds  Minutes  Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.

# Execution Restriction Specification for whether or not there is a restriction for this task to be run, skipped, or held. Options are: -- None -- No restriction for this task. • Run Restriction for when this task will be run. • Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held. If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow. Restriction Period If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted. Options are: None – No period of restriction for this task. Restriction is valid if the date is before the Before Date value. Restriction is valid if the date is after the After Date value. Restriction is valid if the date is before the Before Date value and after After Date value. On Restriction is valid if the date is one of the Date List values. Before Date If Restriction Period = Before or Span; Date before which the restriction is valid. Before Time If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid. After Date If Restriction Period = After or Span; Date after which the restriction is valid. After Time If Restriction Period = After or Span; Time on the selected date after which the restriction is valid. Date List If Restriction Period = On; Date(s) on which the restriction is valid. **Statistics** This section contains time-related statistics for task instances of the task.

First Time Ran	System-supplied; date and time this task first ran.
Last Time Ran	System-supplied; date and time the task last ran.
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.
Lowest Instance Time	System-supplied; shortest amount of time this task has taken to run.
Average Instance Time	System-supplied; average amount of time this task takes to run.
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.
Number of Instances	System-supplied; number of instances in the database for this task.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Buttons	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Save	Saves a new task record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new task.
Update	Saves updates to the record.

Launch Task	Manually launches the task.
View Parents	Displays a list of any parent Workflow tasks for this task.
Сору	Creates a copy of this task, which you are prompted to rename.
Delete	<ul> <li>Note         You cannot delete a task if it is either:         <ul> <li>Specified in an enabled Trigger.</li> <li>The only task specified in a disabled Trigger.</li> </ul> </li> </ul>
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task.
Tabs	This section identifies the tabs across the top of the Task Details that provide access to additional information about the task.
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.

Actions	Allows you to speci	fy actions that the Controller will take automatically based on events that occur during the execution of this task.
	Events are:	ty actions that the Controller will take automatically based on events that occur during the execution of this task.
	<ul> <li>Task instar</li> <li>Exit codes</li> <li>Late start</li> <li>Late finish</li> <li>Early finish</li> </ul> Actions are:	
	Abort Action	Abort the task if certain events occur. For details, see Abort Actions.
	Email Notification	Send an email if certain events occur. For details, see Email Notification Actions.
	Set Variable	Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow.
	SNMP Notification	Send an email if certain events occur. For details, see SNMP Notification Actions.
	System Operation	Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions.
Virtual Resources	Lists all Virtual Res	ources to which this task is assigned.
Instances	Lists all instances of	of the task.
Mutually Exclusive	Lists all tasks that h	nave been set to be mutually exclusive of this task.
Triggers	triggers. If you add	nat reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current name="" task="">#TRIGGER#. You can change the ired. For instructions on creating triggers, see Triggers.</current>
Notes	Lists all notes asso	ciated with this record.
Versions	Stores copies of all	previous versions of the current record. See Record Versioning.

# **Viewing a Universal Command Task Instance**

When a Universal Command task is launched, the Controller creates a task instance record of that task.

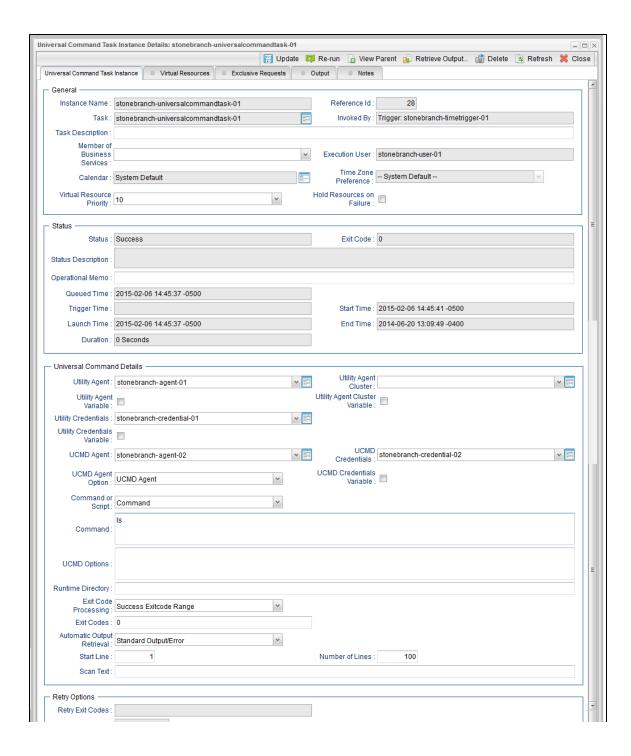

A task instance contains detailed information about a single execution of that task.

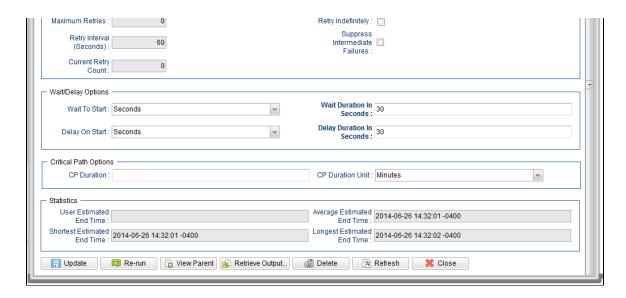

You can access a task instance from:

- Instances tab on the Universal Command Task Details for that task
- Activity Monitor
- Task Instances list

# **Universal Command Task Instance Details**

The following Universal Command Task Instance Details contains information on the execution of the task shown in the Universal Command Task Details.

# **Universal Command Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in Universal Command Task Instance Details.

Field Name	Description
General	This section contains general information about the task instance.
Instance Name	Name of this task instance.
Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.

Invoked by	System-supplied; how the task instance was launched.
	Options:
	<ul> <li>Trigger: (Trigger Name)         Instance was launched by the named trigger.</li> <li>Workflow: (Workflow Name)         Instance was launched by the named workflow.</li> <li>Manually Launched         Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.</li> </ul>
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.
	Options:
	<ul> <li>System Default –         Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxx)</li> </ul>
	Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.  • Inherited  Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.
1 Honey	Options: 1 (high) - 20 (low).
	Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.

Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)
Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.
End Time	System-supplied; Date and time the task instance completed.
Duration	System-supplied; amount of time the task instance took to run.

Universal Command Details	This section contains assorted detailed information about the task instance.	
Utility Agent	Name of the Windows or Linux/Unix Agent resource that will communicate with the Universal Command Agent. If you do not specify an Agent, you must specify an agent cluster.	
Utility Agent Variable	If enabled, the Utility Agent field converts from a reference field (where you browse and select a record) into a text field that allows you to enter a variable. Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.	
	Note When updating multiple Tasks, to change from using a Utility Agent reference to using a Utility Agent variable, you must change the Utility Agent Variable field to Yes and specify the Utility Agent variable in the Utility Agent Unresolved field. Conversely, to change from using a Utility Agent variable to using a Utility Agent reference, you must change the Utility Agent Variable field to No and specify the Utility Agent reference in the Utility Agent field.	
Utility Agent Cluster	Group of Agents, one of which the Controller will choose to run this task. You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific Agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.	
Utility Agent Cluster Variable	Indication of whether the Utility Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Utility Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.	
	Note When updating multiple Tasks, to change from using a Utility Agent Cluster reference to using a Utility Agent Cluster variable, you must change the Utility Agent Cluster Variable field to Yes and specify the Utility Agent Cluster variable in the Utility Agent Cluster Unresolved field. Conversely, to change from using a Utility Agent Cluster variable to using a Utility Agent Cluster reference, you must change the Utility Agent Cluster Variable field to No and specify the Utility Agent Cluster reference in the Utility Agent Cluster field.	
Utility Credentials	Login credentials that the Agent will use to access the Universal Command server machine.  Required if the Agent Credentials Required Universal Controller system property is true.	

### Utility Credentials Variable

Indication of whether the Utility Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Utility Credentials as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Utility Credentials reference to using a Utility Credentials variable, you must change the **Utility Credentials Variable** field to **Yes** and specify the Utility Credentials variable in the **Utility Credentials Unresolved** field. Conversely, to change from using a Utility Credentials variable to using a Utility Credentials reference, you must change the **Utility Credentials Variable** field to **No** and specify the Utility Credentials reference in the **Utility Credentials** field.

### UCMD Agent

Depending on the value in the UCMD Agent Option field, this field contains either:

- Record name from the UCMD Agent table.
- Variable that will be resolved when the task is launched.
- Host name of a machine where the UCMD Agent is running.

## UCMD Agent Option

Specifies how the name of the UCMD Agent is being supplied in the UCMD Agent field.

## Options:

- UCMD Agent UCMD Agent record is selected from the UCMD Agent table.
- UCMD Agent Variable UCMD Agent field contains a variable that will be resolved when the task is launched.
- UCMD Agent Hostname UCMD Agent field contains the host name where the UCMD Agent is running. The host name must be accessible by the Controller.

### UCMD Credentials

Login credentials that Controller will use to access the remote machine where the UCMD Agent is running.

### UCMD Credentials Variable

Indication of whether the UCMD Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the UCMD Credentials as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a UCMD Credentials reference to using a UCMD Credentials variable, you must change the **UCMD**Credentials Variable field to Yes and specify the UCMD Credentials variable in the **UCMD** Credentials Unresolved field. Conversely, to change from using a UCMD Credentials variable to using a UCMD Credentials reference, you must change the **UCMD** Credentials Variable field to **No** and specify the UCMD Credentials reference in the **UCMD** Credentials field.

Command or Script	Specifies whether a single command or a script is being executed.  Options:
	Command (default)     Script
Command	Required if Command or Script = Command; Command being executed on the remote machine. Variables supported.
Script File	Required if Command or Script = Script; Path and filename of the script file that will be executed on the remote machine.
Script Options	If Command or Script = Script; Optional. One or more command line options to pass to the script file.
UCMD Options	Any UCMD options needed by the program to execute properly. Variables supported.
Runtime Directory	Directory from which the application should be executed. Variables supported.
Exit Code Processing	Specifies how the Controller should determine whether the executed command failed or completed successfully.
	Options:
	<ul> <li>Success Exitcode Range         Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field.</li> <li>Failure Exitcode Range         Command is considered failed if its exit code falls within the range specified in the Exit Codes field.</li> </ul>
	<ul> <li>Success Output Contains         Command is considered completed successfully if its output contains the text specified in the Scan Output For field.</li> </ul>
	<ul> <li>Failure Output Contains         Command is considered failed if its output contains the text specified in the Scan Output For field.</li> </ul>
	<ul> <li>Step Conditions (z/OS only)         Command is considered completed successfully/failed if any of its specified condition codes falls within the range specified under the Step Conditions tab (see Creating Step Conditions).</li> </ul>
Output Type	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output.  Options:
	Standard Output (STDOUT) Standard Error (STDERR) File

Exit Codes	Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.
Scan Output For	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this field as a regular expression.
Output File (for Exit Code Processing)	Required if Output Type = File; path and file name of the output file that should be scanned for the text in the Scan Output For field.
Automatic Output Retrieval	Specifies whether you want the Controller to automatically retrieve any output from the job and attach it to the task instance record.  Options:
	<ul> <li>None Do not attach any output to the task instance record.</li> <li>Standard Output Attach all standard output.</li> <li>Standard Error Attach standard error output.</li> <li>File Attach the file specified in the Output File field.</li> <li>Standard Output/Error Attach all standard output and standard error output.</li> </ul>
	Note Tasks specifying Automatic Output Retrieval will fail with Start Failure if the Agent Output Prohibited field is true in the Details of the specified Agent.
Start Line	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Instructs the Controller to retrieve data beginning at the line indicated.  • If a <b>Start Line</b> value is not specified, the default is 1.  • If the <b>Start Line</b> value is -1, data will be retrieved starting at the end of the file.
Number of Lines	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Allows you to limit the retrieved data to the number of lines specified. If a Number of Lines value is not specified, the default is the value of the Retrieve Output Default Number Of Lines Universal Controller system property.

If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Regex pattern that the Controller will search for a match for in STDOUT/STDERR or a specified file. The Controller will include the <b>Number of Lines</b> above and below the first line matched.
if the Regex pattern is not found, the following message is returned: OPSWISE WARNING - Scan text string not found.
Required if Automatic Output Retrieval = File; path and file name containing the output that you want automatically retrieved and attached to the task instance.
This section contains specifications for retrying the task.
Exit code range for which an auto-retry of tasks in FAILED status will occur. Exit code ranges must be in the same format as ranges specified in the Exit Codes field. Maximum Retries must be greater than 0.
If this field is empty, any exit code potentially will cause a retry.
User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
User-defined; number of seconds between each retry.
System-supplied; current number of times that the Controller has retried the task after it first went to failure status.
User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:
All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.
Workflow conditional path processing; any Successors waiting on a failure path will not be released.
<ul> <li>Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which Suppress Intermediate Failures has been enabled.</li> </ul>
Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
System-supplied for a task instance in the Failed status that is scheduled for automatic retry; Next time that a retry will be made. If a task instance is not scheduled for automatic retry, Next Retry Time does not display in the task instance Details.

Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.  Options are:  - None -  Time Relative Time Duration Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	Valid values:  • None • If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example, it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. • Same Day Do not advance day. • Next Day Advance to the next day. • Next Business Day Advance to the next day. • Next Business Day Advance to the next day. • Nonday If today is not Monday, advance to next Monday. • Tuesday If today is not fuesday, advance to next Tuesday. • Wednesday If today is not fuesday, advance to next Hondady. • Thursday If today is not Thursday, advance to next Thursday. • Friday If today is not Thursday, advance to next Friday. • Saturday If today is not Friday, advance to next Friday. • Saturday If today is not Saturday, advance to next Saturday.

Wait Duration In Seconds  Delay On Start  An he	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.  If Wait To Start = Seconds; Number of seconds to wait before starting the task.  Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being
Duration In Seconds If Seconds Ahe	
Start A	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example; it is not being
	neld, it is not waiting on any predecessors, or there is no wait time specified.  Options are:  - None -  Duration - Seconds
Delay Duration If	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Time TI Options	This section contains time-related specifications for the task instance.
St	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Started Late S	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
,,	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time If	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

## Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Dav Advance to a specific number of days in the future. Default is - None --. Late Start Nth Amount If Late Start Day Constraint = Nth Day; Number of days to advance. Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • — None — Advance to the next day if the specified late finish time is before the Created time of the task instance. • Same Day Do not advance day. • Next Day Advance to the next day. • Next Business Day Advance to the next business day. • Sunday If today is not Sunday, advance to next Sunday. • Monday If today is not Monday, advance to next Monday. • Tuesday If today is not Tuesday, advance to next Tuesday. • Wednesday If today is not Wednesday, advance to next Wednesday. • Thursday If today is not Thursday, advance to next Thursday. • Friday If today is not Thursday, advance to next Friday. • Saturday If today is not Saturday, advance to next Friday. • Saturday If today is not Saturday, advance to next Saturday. • Nth Day Advance to a specific number of days in the future.  Default is — None —.
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:
	<ul> <li>Time - Flag the task if it finishes before the specified time (see Early Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.</li> </ul>
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  - None Advance to the next day if the specified early finish time is before the Created time of the task instance. Same Day Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Thursday If today is not Friday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future.
	Default is – None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.

# CP Duration (Resolved)

Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.

### CP Duration Unit

Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select **Minutes** in this field.

### Options:

- Seconds
- Minutes
- Hours

#### Default is Minutes.

## Workflow Execution Options

This section contains Execution Restriction specifications for the task if it is within a Workflow.

# Execution Restriction

Specification for whether or not there is a restriction for this task to be run, skipped, or held.

### Options are:

- -- None -- No restriction for this task.
- Run Restriction for when this task will be run.
- Skip Restriction for when this task will be skipped.
- Hold Restriction for when this task will be held.

If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

### Restriction Period

If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.

### Options are:

- None
  - No period of restriction for this task.
- Before
  - Restriction is valid if the date is before the Before Date value.
- After
- Restriction is valid if the date is after the After Date value.
- Span
- Restriction is valid if the date is before the Before Date value and after After Date value.
- On

Restriction is valid if the date is one of the Date List values.

Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instance.
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Status History	History of all statuses that the task instance has gone through.

Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.
Update	Saves updates to the record.
Force Finish	See Force Finishing a Task.
Hold	Places the task instance on Hold (see Putting a Task on Hold).
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.
Re-run	See Re-running a Task.
View Parent	Displays the task instance Details for the parent Workflow of this task instance.
Retrieve Output	See Retrieving Output.
Delete	Deletes the current record.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task instance.
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.
Virtual Resources	Lists all Virtual Resources to which this task is assigned.
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.
Output	Displays output generated from the process, if any, based on specifications provided by the user in the Automatic Output Retrieval fields in the task Details.  If automatic output retrieval was not available or was not selected, output can be obtained by clicking the Retrieve Output button.
Notes	Lists all notes associated with this record.

# **Output Redirection**

An Agent processes Universal Command, File Transfer/UDM, and SAP task types differently than Windows and Linux/Unix task types. Universal Command, File Transfer/UDM, and SAP command lines are sent to the user process via standard input, so any redirection operators entered as task command input are not processed as expected.

If you want to direct output from a Universal Command task to your file system, the **-uagstdio** command option lets you specify the same output redirection commands that are available for Windows and Linux/Unix task types. UAG will apply the user-specified value for **-uagstdio** directly to the command image.

The I/O redirection commands that you can use with **-uagstdio** are dependent on the OS/command shell. You should be able to set up any redirection that the OS/command shell supports (just as with Windows and Unix/Linux task types).

The syntax of -uagstdio is similar to Universal Command, Universal Data Mover, and Universal Connector command line options; option followed by value.

For the Universal Command task type, you can specify uagstdio in either of the following fields:

- Command
- Universal Command Options

## -uagstdio Examples

-uagstdio >C:\UNIVERSAL COMMANDOUT\Universal Command.out

If the -uagstdio value contains spaces, it must be enclose in double quotation marks ( " ):

-uagstdio ">C:\UNIVERSAL COMMANDOUT\Universal Command.out 2>C:\UNIVERSAL COMMANDOUT\Universal Command.err"

If the quoted value itself requires double quotation marks, they must be doubled (""):

-uagstdio ">C:\tmp\""Universal Command output""\Universal Command.out 2>C:\tmp\""Universal Command output""\Universal Command.err"

# **Running a Universal Command Task**

You can run a Universal Command task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the Universal Command tasks list or Universal Command Task Details Action menu.
- As part of a workflow.
- Specify triggers that run the task automatically based on times or events.

# **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

## Overview

#### Note

These instructions assume the user has a working knowledge of SAP.

The SAP task allows you to send commands to an SAP system and gather status information and output back from SAP. The SAP task uses Stonebranch's proprietary Universal Connector for SAP (USAP) to communicate with SAP. Universal Connector for SAP allows Universal Connect to an SAP system and manage SAP background processing tasks.

# **Before You Begin**

To run an SAP task, you must first complete the following:

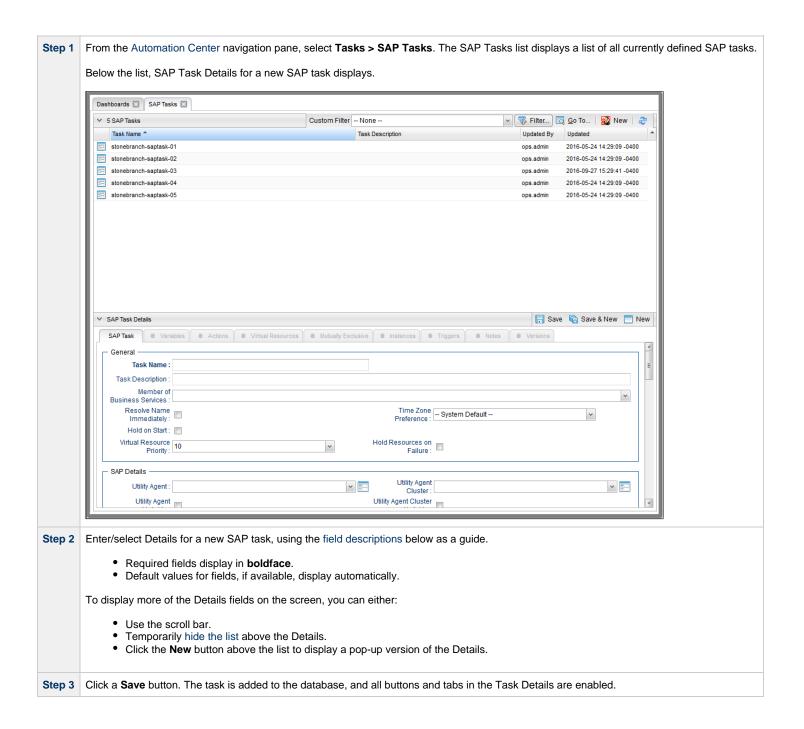

- Identify the Utility Agent that has Universal Connector for SAP installed and licensed; either a Universal Agent for Linux/Unix or a Universal Agent for Windows that will interface with the SAP system.
- Define an SAP connection in the Controller database.

# **Built-In Variables**

The following built-in variables can be used in an SAP task to pass data where appropriate:

- Task Instance variables
- Agent-Based Task Instance variables
- SAP Task variables

# **Creating an SAP Task**

#### Note

To open an existing record on the list, either:

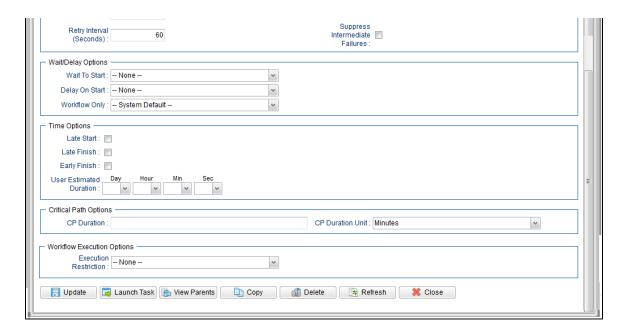

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click **Open In Tab** in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

## **SAP Task Details**

The following SAP Task Details is for an existing SAP task.

Depending on the values that you enter / select for these fields, and whether or not the SAP task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the SAP Task Details.

## **SAP Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the SAP Task Details.

Field Name	Description	
General	This section contains general information about the task.	
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.	
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.	
Task Description	Description of this record. (Maximum = 200 characters.)	
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.	

Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.
Hold Reason	Information about why the task will be put on hold when it starts.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
SAP Details	This section contains assorted detailed information about the task.
Utility Agent	Name of the Linux/Unix or Windows Agent that will communicate with the SAP system. If you do not specify an Agent, you must specify an agent cluster.

### Utility Agent Variable

If enabled, the Utility Agent field converts from a reference field (where you browse and select a record) into a text field that allows you to enter a variable. Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Utility Agent reference to using a Utility Agent variable, you must change the **Utility Agent Variable** field to **Yes** and specify the Utility Agent variable in the **Utility Agent Unresolved** field. Conversely, to change from using a Utility Agent variable to using a Utility Agent reference, you must change the **Utility Agent Variable** field to **No** and specify the Utility Agent reference in the **Utility Agent** field.

### **Utility Agent Cluster**

Group of Agents, one of which the Controller will choose to run this task. You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific Agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.

#### Utility Agent Cluster Variable

Indication of whether the Utility Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Utility Agent Cluster as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Utility Agent Cluster reference to using a Utility Agent Cluster variable, you must change the Utility Agent Cluster Variable field to Yes and specify the Utility Agent Cluster variable in the Utility Agent Cluster Unresolved field. Conversely, to change from using a Utility Agent Cluster variable to using a Utility Agent Cluster reference, you must change the Utility Agent Cluster Variable field to No and specify the Utility Agent Cluster reference in the Utility Agent Cluster field.

### **Utility Credentials**

Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.

Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

#### Utility Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials**Variable field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

SAP Connection	Name of the SAP connection. The SAP connection specifies information about the SAP server. Select an existing SAP Connection from the drop-down list or click the icon to create a new SAP Connection.
SAP Connection Variable	Indication of whether the SAP Connection field is a reference field for selecting a specific SAP Connection (unchecked) or a text field for specifying the SAP Connection as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using an SAP Connection reference to using an SAP Connection variable, you must change the SAP Connection Variable field to Yes and specify the SAP Connection variable in the SAP Connection Unresolved field. Conversely, to change from using an SAP Connection variable to using an SAP Connection reference, you must change the SAP Connection Variable field to No and specify the SAP Connection reference in the SAP Connection field.
SAP Language	SAP logon language used when executing the SAP task. Valid values are:  • Any valid 1-character SAP language identifier.  • Any valid 2-character ISO language identifier.  • (no value). SAP will use the default language set up for the user. If there is no such default, the default is EN (English).
SAP Credentials	Login credentials that the Controller will use to access the SAP system. The credentials are stored in the Universal Controller credentials table; see Credentials.
SAP Credentials Variable	Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the Credentials Variable field to Yes and specify the Credentials variable in the Credentials Unresolved field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the Credentials Variable field to No and specify the Credentials reference in the Credentials field.
SAP Job Name	Job name of the SAP job. Variables supported.
SAP Job ID	Job ID of the SAP job. Variables supported.  Required for the Wait, Abort, Purge Job, and Display commands.

SAP Process Chain Log ID	Log ID for process chain instance to be monitored to completion.	
SAP InfoPackage Request ID	Request ID of the InfoPackage that is to be monitored.	
Command Group	See Universal Connector Commands, below, for a description of all supported commands and their contingent fields (options).	
SAP Command Options	Use this field to specify any additional command options supported by Universal Connector (USAP).	
Runtime Directory	Directory from which the application should be executed. Variables supported.	
Environment Variables	Allows you to enter environment variables needed by the program to run.	
	To add a variable, click the + icon and enter a Name and Value. To delete a variable, select in the list of variables and click the - icon.	
	You can add a maximum of 4,000 characters for the combined Names and Values of all variables. The variable is listed in the space underneath.	
Exit Code Processing	Specifies how the Controller should determine whether the executed command failed or completed successfully.	
	<ul> <li>Success Exitcode Range Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field.</li> <li>Failure Exitcode Range Command is considered failed if its exit code falls within the range specified in the Exit Codes field.</li> <li>Success Output Contains Command is considered completed successfully if its output contains the text specified in the Scan Output For field.</li> <li>Failure Output Contains Command is considered failed if its output contains the text specified in the Scan Output For field.</li> <li>Step Conditions (z/OS only) Command is considered completed successfully/failed if any of its specified condition codes falls within the range specified under the Step Conditions tab (see Creating Step Conditions).</li> </ul>	
Output Type	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output.  Options:  Standard Output (STDOUT) Standard Error (STDERR) File	

Scan Output For	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this field as a regular expression.
Output File (for Exit Code Processing)	Required if Output Type = File; path and file name of the output file that should be scanned for the text in the Scan Output For field.
Exit Codes	Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.
Automatic Output Retrieval	Specifies whether you want the Controller to automatically retrieve any output from the job and attach it to the task instance record.  Options:  None Do not attach any output to the task instance record. Standard Output Attach all standard output. Standard Error Attach standard error output. File Attach the file specified in the Output File field. Standard Output/Error Attach all standard output and standard error output.
	Note Tasks specifying Automatic Output Retrieval will fail with Start Failure if the Agent Output Prohibited field is true in the Details of the specified Agent.
Start Line	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Instructs the Controller to retrieve data beginning at the line indicated.  • If a Start Line value is not specified, the default is 1.  • If the Start Line value is -1, data will be retrieved starting at the end of the file.
Number of Lines	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Allows you to limit the retrieved data to the number of lines specified. If a Number of Lines value is not specified, the default is the value of the Retrieve Output Default Number Of Lines Universal Controller system property.
Scan Text	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Regex pattern that the Controller will search for a match for in STDOUT/STDERR or a specified file. The Controller will include the <b>Number of Lines</b> above and below the first line matched.  if the Regex pattern is not found, the following message is returned: OPSWISE WARNING - Scan text string not found.

Output File (for Automatic Output Retrieval)	Required if Automatic Output Retrieval = File; path and file name containing the output that you want automatically retrieved and attached to the task instance.	
Retry Options	This section contains specifications for retrying the task.	
Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.	
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.	
Retry Interval (Seconds)	User-defined; number of seconds between each retry.	
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:  • All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.  • Workflow conditional path processing; any Successors waiting on a failure path will not be released.  • Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which Suppress Intermediate Failures has been enabled.  • Any Workflow containing the Failed task instance will not transition to the Running/Problems status.	
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.	
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.  Options are:  - None Time - Relative Time - Duration - Seconds	
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.	

Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	- None  • If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.  • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.  • Same Day  Do not advance day.  • Next Day  Advance to the next day.  • Next Business Day  Advance to the next business day.  • Sunday  If today is not Sunday, advance to next Sunday.  • Monday  If today is not Monday, advance to next Monday.  • Tuesday  If today is not Tuesday, advance to next Wednesday.  • Thursday  If today is not Tuesday, advance to next Hursday.  • Friday  If today is not Thursday, advance to next Friday.  • Saturday  If today is not Friday, advance to next Friday.  • Saturday  If today is not Saturday, advance to next Saturday.  Default is — None —.
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.
Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.  Options are:  - None -  Duration Seconds

Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  Options are:  • System Default Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.) • Yes Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow. • No Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
Constraint	Valid values:
	Valid values:
Late Start Nth Amount	Default is – None  If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.  For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.  For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

ate Finish Type	Required if Late Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
ate Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
ate Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.
	Valid values:
	<ul> <li> None Advance to the next day if the specified late finish time is before the Created time of the task instance.</li> </ul>
	• Same Day
	Do not advance day.  • Next Day
	Advance to the next day.  • Next Business Day
	Advance to the next business day.  • Sunday
	If today is not Sunday, advance to next Sunday.  • Monday
	If today is not Monday, advance to next Monday.  • Tuesday
	If today is not Tuesday, advance to next Tuesday.
	Wednesday     If today is not Wednesday, advance to next Wednesday.
	Thursday     If today is not Thursday, advance to next Thursday.
	Friday     If today is not Friday, advance to next Friday.
	Saturday     If today is not Saturday, advance to next Saturday.
	Nth Day     Advance to a specific number of days in the future.
	Default is – None
ate Finish Nth	If Late Finish Day Constraint = Nth Day; Number of days to advance.
an Park Book	
ate Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.

Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	Valid values:  - None - Advance to the next day if the specified early finish time is before the Created time of the task instance. Same Day Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Wednesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Thursday If today is not Thursday, advance to next Thursday. Thursday If today is not Thursday, advance to next Thursday. Thursday If today is not Thursday, advance to next Friday. Saturday If today is not Saturday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future.  Default is - None

Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds Minutes Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.

Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.  Options are:  None No restriction for this task Run Restriction for when this task will be run Skip Restriction for when this task will be skipped Hold Restriction for when this task will be held.  If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.
Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.  Options are:  • - None - No period of restriction for this task. • Before Restriction is valid if the date is before the Before Date value. • After Restriction is valid if the date is after the After Date value. • Span Restriction is valid if the date is before the Before Date value and after After Date value. • On Restriction is valid if the date is one of the Date List values.
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for task instances of the task.

Last Instance Duration	System-supplied; date and time the task last ran.  System-supplied; amount of time the task took to run the last time it ran.  System-supplied; shortest amount of time this task has taken to run.
S	
	System-supplied; shortest amount of time this task has taken to run.
Lowest Instance Time	
Average Instance Time	System-supplied; average amount of time this task takes to run.
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.
Number of Instances	System-supplied; number of instances in the database for this task.
Metadata T	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By N	Name of the user that last updated this record.
Updated D	Date and time that this record was last updated.
Created By N	Name of the user that created this record.
Created D	Date and time that this record was created.
Buttons T	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Save S	Saves a new task record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New D	Displays empty (except for default values) Details for creating a new task.
<b>Update</b> S	Saves updates to the record.
Launch Task	Manually launches the task.

View Parents	Displays a list of any parent Workflow tasks for this task.	
Сору	Creates a copy of this task, which you are prompted to rename.	
Delete	Deletes the current record.	
	<ul> <li>Note         You cannot delete a task if it is either:         <ul> <li>Specified in an enabled Trigger.</li> <li>The only task specified in a disabled Trigger.</li> </ul> </li> </ul>	
Refresh	Refreshes any dynamic data displayed in the Details.	
Close	For pop-up view only; closes the pop-up view of this task.	
Tabs	This section identifies the tabs across the top of the Task Details that provide access to additional information about the task instance.	
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.	

Actions	A.U	
	Events are:	cify actions that the Controller will take automatically based on events that occur during the execution of this task.
	Task insta Exit code Late start Late finish Early finish	s : h
	Actions are:	
	Abort Action	Abort the task if certain events occur. For details, see Abort Actions.
	Email Notification	Send an email if certain events occur. For details, see Email Notification Actions.
	Set Variable	Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow.
	SNMP Notification	Send an email if certain events occur. For details, see SNMP Notification Actions.
	System Operation	Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions.
Virtual Resources	Lists all Virtual Re	esources to which this task is assigned.
Mutually Exclusive	Lists all tasks that	have been set to be mutually exclusive of this task.
Instances	Lists all instances	of the task.
Triggers	add new triggers.	that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current name="" task="">#TRIGGER#. he default name if desired. For instructions on creating triggers, see Triggers.</current>
Notes	Lists all notes ass	ociated with this record.
Versions	Stores copies of a	all previous versions of the current record. See Record Versioning.

# Viewing an SAP Task Instance

When an SAP task is launched, the Controller creates a task instance record of that task.

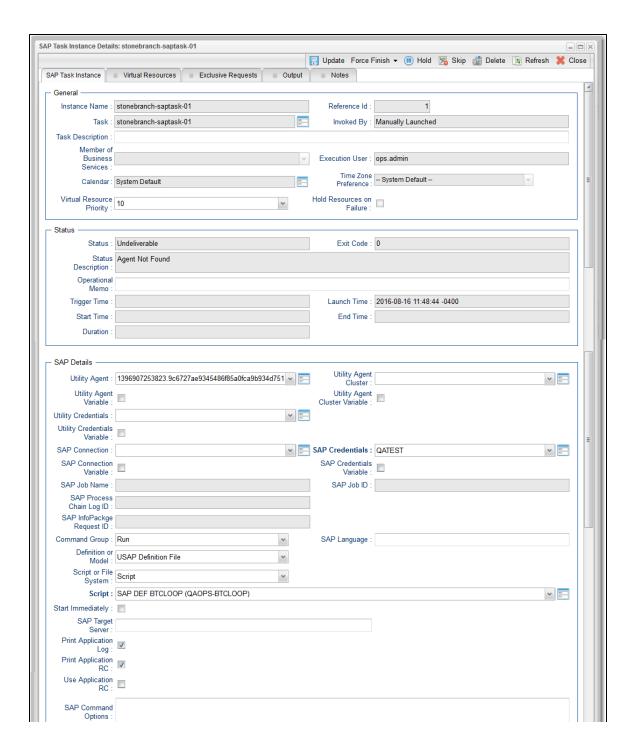

A task instance contains detailed information about a single execution of that task.

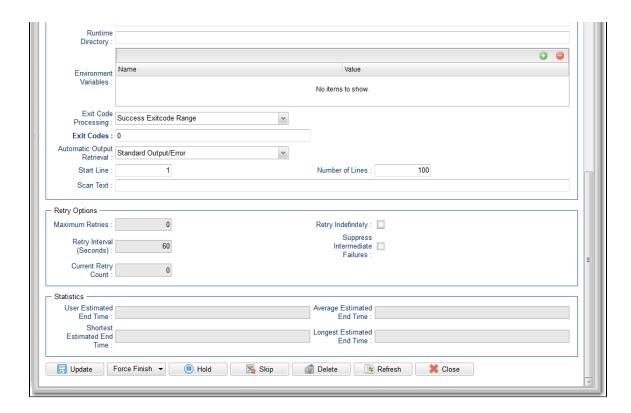

You can access a task instance from:

- Instances tab on the SAP Task Details for that task
- Activity Monitor
- Task Instances list

### **SAP Task Instance Details**

The following SAP Task Instance Details contains information on the execution of the task shown in the SAP Task Details.

### **SAP Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in SAP Task Instance Details.

Field Name	Description	
General	This section contains general information about the task instance.	
Instance Name	Name of this task instance.	
Reference Id	System-supplied; the Controller increments this number each time the task is run.	
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.	

Invoked by	System-supplied; how the task instance was launched.
	Options:
	<ul> <li>Trigger: (Trigger Name) Instance was launched by the named trigger.</li> <li>Workflow: (Workflow Name) Instance was launched by the named workflow.</li> <li>Manually Launched Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.</li> </ul>
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.
	Options:
	<ul> <li>System Default –         Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxx)</li> </ul>
	Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.  • Inherited  Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.
	Options: 1 (high) - 20 (low).
	Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.

Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)
Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.
End Time	System-supplied; Date and time the task instance completed.
Duration	System-supplied; amount of time the task instance took to run.
SAP Details	This section contains assorted detailed information about the task instance.

Utility Agent	Name of the Linux/Unix or Windows Agent that will communicate with the SAP system. If you do not specify an Agent, you must specify an agent cluster.	
Utility Agent Variable	If enabled, the Utility Agent field converts from a reference field (where you browse and select a record) into a text field that allows you to enter a variable. Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.	
	Note When updating multiple Tasks, to change from using a Utility Agent reference to using a Utility Agent variable, you must change the Utility Agent Variable field to Yes and specify the Utility Agent variable in the Utility Agent Unresolved field. Conversely, to change from using a Utility Agent variable to using a Utility Agent reference, you must change the Utility Agent Variable field to No and specify the Utility Agent reference in the Utility Agent field.  Agent field.	
Utility Agent Cluster	Group of Agents, one of which the Controller will choose to run this task. You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific Agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.	
Utility Agent Cluster Variable	Indication of whether the Utility Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Utility Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.	
	Note When updating multiple Tasks, to change from using a Utility Agent Cluster reference to using a Utility Agent Cluster variable, you must change the Utility Agent Cluster Variable field to Yes and specify the Utility Agent Cluster variable in the Utility Agent Cluster Unresolved field. Conversely, to change from using a Utility Agent Cluster variable to using a Utility Agent Cluster reference, you must change the Utility Agent Cluster Variable field to No and specify the Utility Agent Cluster reference in the Utility Agent Cluster field.	
Utility Credentials	Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.  Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.	

# **Utility Credentials** Variable Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions. Note When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the Credentials Variable field to Yes and specify the Credentials variable in the Credentials Unresolved field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the Credentials Variable field to No and specify the Credentials reference in the Credentials field. SAP Connection Name of the SAP connection. The SAP connection specifies information about the SAP server. Select an existing SAP Connection from the drop-down list or click the icon to create a new SAP Connection. SAP Connection Indication of whether the SAP Connection field is a reference field for selecting a specific SAP Connection (unchecked) or a text field for specifying the SAP Connection Variable as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions. Note When updating multiple Tasks, to change from using an SAP Connection reference to using an SAP Connection variable, you must change the SAP Connection Variable field to Yes and specify the SAP Connection variable in the SAP Connection Unresolved field. Conversely, to change from using an SAP Connection variable to using an SAP Connection reference, you must change the SAP Connection Variable field to No and specify the SAP Connection reference in the SAP Connection field. SAP Language SAP logon language used when executing the SAP task. Valid values are: • Any valid 1-character SAP language identifier. • Any valid 2-character ISO language identifier. . (no value). SAP will use the default language set up for the user. If there is no such default, the default is EN (English). SAP Credentials Login credentials that the Controller will use to access the SAP system. The credentials are stored in the Universal Controller credentials table; see Credentials.

# SAP Credentials Variable Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions. Note When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the Credentials Variable field to Yes and specify the Credentials variable in the Credentials Unresolved field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the Credentials Variable field to No and specify the Credentials reference in the Credentials field. SAP Job Name Job name of the SAP job. Variables supported. SAP Job ID Job ID of the SAP job. Variables supported. Required for the Wait, Abort, Purge Job, and Display commands. See Universal Connector Commands, below, for SAP Job ID usage with the Run, Submit, Start, and Generate Job Definition commands. SAP Process Chain Log ID Log ID for process chain instance to be monitored to completion. SAP InfoPackage Request ID Request ID of the InfoPackage that is to be monitored. Command Group See Universal Connector Commands, below, for a description of all supported commands and their contingent fields (options). **SAP Command Options** Use this field to specify any additional command options supported by Universal Connector (USAP). Runtime Directory Directory from which the application should be executed. Variables supported. (Environment Variables) Allows you to enter environment variables needed by the program to run. Name and Value To add a variable, click the + icon and enter a Name and Value. To delete a variable, select in the list of variables and click the - icon. You can add a maximum of 4,000 characters for the combined Names and Values of all variables. The variable is listed in the space underneath.

Exit Code Processing	Specifies how the Controller should determine whether the executed command failed or completed successfully.
	Options:
	<ul> <li>Success Exitcode Range Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field.</li> <li>Failure Exitcode Range Command is considered failed if its exit code falls within the range specified in the Exit Codes field.</li> <li>Success Output Contains Command is considered completed successfully if its output contains the text specified in the Scan Output For field.</li> <li>Failure Output Contains Command is considered failed if its output contains the text specified in the Scan Output For field.</li> <li>Step Conditions (z/OS only) Command is considered completed successfully/failed if any of its specified condition codes falls within the range specified under the Step Conditions tab (see Creating Step Conditions).</li> </ul>
Output Type	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output.  Options:  Standard Output (STDOUT) Standard Error (STDERR) File
Scan Output For	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this field as a regular expression.
Output File (for Exit Code Processing)	Required if Output Type = File; path and file name of the output file that should be scanned for the text in the Scan Output For field.
Exit Codes	Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.

Automatic Output Retrieval	Specifies whether you want the Controller to automatically retrieve any output from the job and attach it to the task instance record.	
	Options:	
	<ul> <li>None Do not attach any output to the task instance record.</li> <li>Standard Output Attach all standard output.</li> <li>Standard Error Attach standard error output.</li> <li>File Attach the file specified in the Output File field.</li> <li>Standard Output/Error Attach all standard output and standard error output.</li> </ul>	
	Note Tasks specifying Automatic Output Retrieval will fail with Start Failure if the Agent Output Prohibited field is true in the Details of the specified Agent.	
Start Line	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Instructs the Controller to retrieve data beginning at the line indicated.	
	<ul> <li>If a Start Line value is not specified, the default is 1.</li> <li>If the Start Line value is -1, data will be retrieved starting at the end of the file.</li> </ul>	
Number of Lines	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Allows you to limit the retrieved data to the number of lines specified. a Number of Lines value is not specified, the default is the value of the Retrieve Output Default Number Of Lines Universal Controller system property.	
Scan Text	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Regex pattern that the Controller will search for a match for in STDOUT/STDERR or a specified file. The Controller will include the <b>Number of Lines</b> above and below the first line matched.	
	if the Regex pattern is not found, the following message is returned: OPSWISE WARNING - Scan text string not found.	
Output File (for Automatic Output Retrieval)	Required if Automatic Output Retrieval = File; path and file name containing the output that you want automatically retrieved and attached to the task instance.	
<b>Retry Options</b>	This section contains specifications for retrying the task.	
Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.	

Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval (Seconds)	User-defined; number of seconds between each retry.
Current Retry Count	System-supplied; current number of times that the Controller has retried the task after it first went to failure status.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:  • All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.  • Workflow conditional path processing; any Successors waiting on a failure path will not be released.  • Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which Suppress Intermediate Failures has been enabled.  • Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
Next Retry Time	System-supplied for a task instance in the Failed status that is scheduled for automatic retry; Next time that a retry will be made. If a task instance is not scheduled for automatic retry, Next Retry Time does not display in the task instance Details.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.  Options are:  - None -  Time Relative Time Duration Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	<ul> <li>None  • If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>• If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> <li>• Same Day  Do not advance day.</li> <li>• Next Day  Advance to the next day.</li> <li>• Next Business Day  Advance to the next business day.</li> <li>• Sunday  If today is not Sunday, advance to next Sunday.</li> <li>• Monday  If today is not Monday, advance to next Monday.</li> <li>• Tuesday  If today is not Tuesday, advance to next Tuesday.</li> <li>• Wednesday  If today is not Wednesday, advance to next Wednesday.</li> </ul>
	<ul> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> </ul>
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.
Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.
	Options are:
	<ul> <li>- None -</li> <li>Duration</li> <li>Seconds</li> </ul>

Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Time Options	This section contains time-related specifications for the task instance.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
	Valid values:
	None Advance to the next day if the specified late start time is before the Created time of the task instance.  Same Day Do not advance day.  Next Day Advance to the next day.  Next Business Day Advance to the next business day.  Sunday If today is not Sunday, advance to next Sunday.  Monday If today is not Monday, advance to next Monday.  Tuesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Wednesday, advance to next Wednesday.  Thursday If today is not Thursday, advance to next Wednesday.  Friday If today is not Thursday, advance to next Friday.  Saturday If today is not Friday, advance to next Friday.  Saturday If today is not Saturday, advance to next Saturday.  Nth Day Advance to a specific number of days in the future.
Late Start Nth Amount	
	If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.  For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.
	For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  - None Advance to the next day if the specified late finish time is before the Created time of the task instance Same Day Do not advance day Next Day Advance to the next day Next Business Day Advance to the next business day Sunday If today is not Sunday, advance to next Sunday Monday If today is not Monday, advance to next Monday Tuesday If today is not Tuesday, advance to next Tuesday Wednesday If today is not Wednesday, advance to next Wednesday Thursday If today is not Thursday, advance to next Thursday Friday If today is not Friday, advance to next Friday Saturday If today is not Saturday, advance to next Saturday Nth Day Advance to a specific number of days in the future.  Default is - None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early Finish Day	
Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.
	Valid values:
	None     Advance to the next day if the specified early finish time is before the Created time of the task instance.      Same Day     Do not advance day.      Next Day     Advance to the next day.      Next Business Day     Advance to the next business day.      Sunday     If today is not Sunday, advance to next Sunday.      Monday     If today is not Monday, advance to next Monday.      Tuesday     If today is not Tuesday, advance to next Tuesday.      Wednesday     If today is not Wednesday, advance to next Wednesday.      Thursday     If today is not Thursday, advance to next Thursday.      Friday     If today is not Thursday, advance to next Thursday.  Friday     If today is not Friday, advance to next Friday.
	Saturday
	If today is not Saturday, advance to next Saturday.  • Nth Day
	Advance to a specific number of days in the future.
	Default is – None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.

CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.
	Options:
	<ul> <li>Seconds</li> <li>Minutes</li> <li>Hours</li> </ul>
	Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.
Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.
	Options are:
	<ul> <li> None No restriction for this task.</li> <li>Run Restriction for when this task will be run.</li> <li>Skip Restriction for when this task will be skipped.</li> <li>Hold Restriction for when this task will be held.</li> </ul>
	If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.
Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.
	Options are:
	• - None -
	No period of restriction for this task.  • Before
	Restriction is valid if the date is before the Before Date value.  • After
	Restriction is valid if the date is after the After Date value.
	<ul> <li>Span Restriction is valid if the date is before the Before Date value and after After Date value.</li> <li>On Restriction is valid if the date is one of the Date List values.</li> </ul>
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.

Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.	
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.	
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.	
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.	
Statistics	This section contains time-related statistics for the task instance.	
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.	
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.	
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.	
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.	
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.	
Metadata	This section contains Metadata information about this record.	
UUID	Universally Unique Identifier of this record.	
Updated By	Name of the user that last updated this record.	
Updated	Date and time that this record was last updated.	
Created By	Name of the user that created this record.	
Created	Date and time that this record was created.	
Status History	History of all statuses that the task instance has gone through.	
Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.	
Update	Saves updates to the record.	

Force Finish	See Force Finishing a Task.	
Hold	Places the task instance on Hold (see Putting a Task on Hold).	
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.	
Re-run	See Re-running a Task.	
View Parent	Displays the task instance Details for the parent Workflow of this task instance.	
Retrieve Output	See Retrieving Output.	
SAP	Displays an Action menu of SAP commands.	
Delete	Deletes the current record.	
Refresh	Refreshes any dynamic data displayed in the Details.	
Close	For pop-up view only; closes the pop-up view of this task instance.	
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.	
Virtual Resources	Lists all Virtual Resources to which this task is assigned.	
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.	
Output	Displays output generated from the process, if any, based on specifications provided by the user in the Automatic Output Retrieval fields in the task Details.  If automatic output retrieval was not available or was not selected, output can be obtained by clicking the Retrieve Output button.	
Notes	Lists all notes associated with this record.	

# **Output Redirection**

An Agent processes SAP, Universal Command, and File Transfer/UDM task types differently than Windows and Linux/Unix task types. SAP, Universal Command, and File Transfer/UDM command lines are sent to the user process via standard input, so any redirection operators entered as task command input are not processed as expected.

If you want to direct output from an SAP task to your file system, the **-uagstdio** command option lets you specify the same output redirection commands that are available for Windows and Linux/Unix task types. UAG will apply the user-specified value for **-uagstdio** directly to the command image.

The I/O redirection commands that you can use with **-uagstdio** are dependent on the OS/command shell. You should be able to set up any redirection that the OS/command shell supports (just as with Windows and Unix/Linux task types).

The syntax of -uagstdio is similar to Universal Data Mover, Universal Command, and Universal Connector command line options; option followed by value.

For the SAP task type, you can specify **uagstdio** in the following field:

SAP Command Options

### -uagstdio Examples

```
-uagstdio >C:\SAPOUT\sap.out
```

If the -uagstdio value contains spaces, it must be enclose in double quotation marks ( "):

```
-uagstdio ">C:\SAPOUT\sap.out 2>C:\SAPOUT\sap.err"
```

If the quoted value itself requires double quotation marks, they must be doubled (""):

```
-uagstdio ">C:\tmp\""sap output""\sap.out 2>C:\tmp\""sap output""\sap.err"
```

### **Universal Connector Commands**

The following table identifies supported Universal Connector commands, describes the actions that each command performs, and lists each command's related options, which display in the SAP Task Details when that command is selected.

Command Name	Description	Options	
Run	Performs the following actions:	<ul> <li>Definition or Model</li> <li>Specifies how the new SAP job will be created, based either on a USAP Definition File or an SAP Model Job.</li> </ul>	

- Defines a new SAP, job based on either a USAP Definition file or an SAP Model Job.
- 2. Starts the defined job.
- 3. Waits for the job to complete.
- 4. Prints the job's joblog to standard error and the spoollists to standard output.
- 5. Purges the job from the SAP system.

### Script or File System

Specifies whether the USAP definition file exists in the file system of the machine where the Agent is running or in Scripts.

### Script

Required if **Script or File System** = Script; Name of the script in the Controller database that will be executed by this task.

#### Note

If you click the Details icon for a Script selected in this field, the Script Type field in the Details is read-only.

### Definition File

If you selected USAP Definition File above, use this field to provide the path and file name of the file.

### SAP Job Name

Job name of the SAP job. Variables supported.

### SAP Job ID

Job ID of the SAP job. Variables supported.

For Utility Agents older than Universal Agent 6.4.2.2, this is a required field.

If you are using a newer Utility Agent, specifying a Job ID of the target SAP job will ensure that it always can be uniquely identified.

If you do not specify a Job ID, one of the following applies:

- If the target SAP system has only one job with the specified name for the specified user in a status of scheduled, it is uniquely identified.
- If the target SAP system has multiple jobs with the specified name for the specified user:
  - By default, we select the scheduled job if only one exists.
  - You can optionally add an SAP Command Option -model\_status <scheduled | finished | any> to control which SAP job status is used if only one job with the specified status exists.
  - You also can optionally add an SAP Command Option
     -resolve\_multi\_model yes to select the latest SAP job if more than one
     exists.

### Target Job Name

If you selected SAP Model Job above, use this field to provide the name of the new SAP job being created. If you leave this field blank, the Controller uses the same name as the SAP Model Job.

	Start Immediately
	Enabled or disabled. Enabling the Start Immediately flag will cause the job to fail if SAP resources are not available to start the job immediately (for example, a background work process). Otherwise, the job will wait for SAP resources to become available.
	SAP Target Server
	Name of an SAP instance at which a background job should be run. The name has the following format:
	[host name]_[SAP System name]_[SAP System number]
	Where host name is the name of the server computer on which the instance is running, as specified in the system profile parameter SAPLOCALHOST.
	Example:
	hs0123_C11_55
	Print Application Log
	Enabled or disabled. Specifies whether or not the job's application log, if one was generated, is returned.
	Print Application RC
	Enabled or disabled. Specifies whether or not the job's application return codes, if they were set, are returned.
	Use Application RC
	Specifies whether or not the SAP job's application return codes will be used to determine the return code for the Universal Controller task.
Performs the following actions:  1. Starts a process chain. 2. Waits for the process chain to complete. 3. Returns the process chain log. 4. Returns process logs. 5. Returns process spool lists.	Chain ID     ID of the process chain to run.
	<ol> <li>Starts a process chain.</li> <li>Waits for the process chain to complete.</li> <li>Returns the process chain log.</li> <li>Returns process logs.</li> </ol>

Run InfoPackage	Performs the following actions:  1. Starts an InfoPackage. 2. Wait for the InfoPackage request to complete. 3. Returns status messages for the completed Infopackage request.	<ul> <li>InfoPackage         Name of the InfoPackage to run.     </li> <li>InfoPackage Job Name         Name of the SAP batch job that processes the InfoPackage request.     </li> </ul>
Submit	Defines a new SAP job.	Definition or Model Specifies how the new SAP job will be created, based either on a USAP Definition File or an SAP Model Job.  Script or File System Specifies whether the USAP definition file exists in the file system of the machine where the Agent is running or in Scripts.  Script Required if Script or File System = Script; Name of the script in the Controller database that will be executed by this task.  Note If you click the Details icon for a Script selected in this field, the Script Type field in the Details is read-only.  Definition File If you selected USAP Definition File above, use this field to provide the path and file name of the file.  SAP Job Name Job name of the SAP job. Variables supported.

### SAP Job ID

Job ID of the SAP job. Variables supported.

For Utility Agents older than Universal Agent 6.4.2.2, this is a required field.

If you are using a newer Utility Agent, specifying a Job ID of the target SAP job will ensure that it always can be uniquely identified.

If you do not specify a Job ID, one of the following applies:

- If the target SAP system has only one job with the specified name for the specified user in a status of scheduled, it is uniquely identified.
- If the target SAP system has multiple jobs with the specified name for the specified user:
  - By default, we select the scheduled job if only one exists.
  - You can optionally add an SAP Command Option -model\_status <scheduled | finished | any> to control which SAP job status is used if only one job with the specified status exists.
  - You also can optionally add an SAP Command Option
     -resolve\_multi\_model yes to select the latest SAP job if more than one
     exists.

### Target Job Name

If you selected SAP Model Job above, use this field to provide the name of the new SAP job being created. If you leave this field blank, the Controller uses the same name as the SAP Model Job.

### Start

Enabled or disabled. Specifies whether or not the newly-defined SAP job should be started.

### Start Immediately

Enabled or disabled. Enabling the Start Immediately flag will cause the job to fail if SAP resources are not available to start the job immediately (for example, a background work process). Otherwise, the job will wait for SAP resources to become available.

### SAP Target Server

Name of an SAP instance at which a background job should be run. The name has the following format:

[host name]\_[SAP System name]\_[SAP System number]

Where host name is the name of the server computer on which the instance is running, as specified in the system profile parameter SAPLOCALHOST.

Example:

hs0123\_C11\_55

### Wait

Specifies whether the Controller should wait for the SAP process chain to complete processing.

### Print Job Log

Enabled or disabled. Specifies whether or not the job's joblog is returned.

### • Print Spooled Output

Enabled or disabled. Specifies whether or not the spoollists of all job steps are returned.

### • Print Application Log

Enabled or disabled. Specifies whether or not the job's application log, if one was generated, is returned.

### • Print Application RC

Enabled or disabled. Specifies whether or not the job's application return codes, if they were set, are returned.

### • Use Application RC

Specifies whether or not the SAP job's application return codes will be used to determine the return code for the Universal Controller task.

### • SAP ABAP Program Name

Name of an ABAP program in an SAP system to which the model variant belongs.

### • SAP Variant Name

Pre-existing SAP variant name to use as the model variant.

		Target Variant Name     One or more replacement variants for ABAP program job steps in an SAP job.	
Modify	Modifies an SAP job that already exists in an SAP system. A USAP job definition file is used to specify the modifications.	<ul> <li>Script Library or File System         Specifies whether the USAP definition file exists in the file system of the machine where the Agent is running or in Scripts.     </li> <li>Script         Required if Command or Script = Script; Name of the script in the Controller database that will be executed by this task.         Note             If you click the Details icon for a Script selected in this field, the Script Type field in the Details is read-only.     </li> <li>Definition File</li> <li>If you selected USAP Definition File above, use this field to provide the path and file name of the file.</li> <li>SAP Job ID</li> </ul>	
		SAP Job ID  Job ID of the SAP job. Variables supported.	
Start	Starts a currently defined SAP job.	SAP Job Name  Job name of the SAP job. Variables supported.	

### SAP Job ID

Job ID of the SAP job. Variables supported.

For Utility Agents older than Universal Agent 6.4.2.2, this is a required field.

If you are using a newer Utility Agent, specifying a Job ID of the target SAP job will ensure that it always can be uniquely identified.

If you do not specify a Job ID, one of the following applies:

- If the target SAP system has only one job with the specified name for the specified user in a status of scheduled, it is uniquely identified.
- If the target SAP system has multiple jobs with the specified name for the specified user:
  - By default, we select the scheduled job if only one exists.
  - You can optionally add an SAP Command Option -model\_status <scheduled | finished | any> to control which SAP job status is used if only one job with the specified status exists.
  - You also can optionally add an SAP Command Option
     -resolve\_multi\_model yes to select the latest SAP job if more than one
     exists.

### · Start Immediately

Enabled or disabled. Enabling the Start Immediately flag will cause the job to fail if SAP resources are not available to start the job immediately (for example, a background work process). Otherwise, the job will wait for SAP resources to become available.

### SAP Target Server

Name of an SAP instance at which a background job should be run. The name has the following format:

```
[host name]_[SAP System name]_[SAP System number]
```

Where host name is the name of the server computer on which the instance is running, as specified in the system profile parameter SAPLOCALHOST.

Example:

```
hs0123_C11_55
```

### Wait

Specifies whether the Controller should wait for the SAP process chain to complete processing.

### Print Job Log

Enabled or disabled. Specifies whether or not the job's joblog is returned.

	Print Spooled Output
	Enabled or disabled. Specifies whether or not the spoollists of all job steps are returned.
	Print Application Log
	Enabled or disabled. Specifies whether or not the job's application log, if one was generated, is returned.
	Print Application RC
	Enabled or disabled. Specifies whether or not the job's application return codes, if they were set, are returned.
	Use Application RC
	Specifies whether or not the SAP job's application return codes will be used to determine the return code for the Universal Controller task.

Start Process Chain	Starts the specified process chain on the SAP system.	Chain ID     ID of process chain to start.     Restart
		Specification to restart failed and cancelled processes (R or X) in the specified process chain instance.
		• Log ID
		Log ID for process chain instance to be restarted.
		• Wait
		Specifies whether the Controller should wait for the SAP process chain to complete processing.
		Print Job Log
		Enabled or disabled. Specifies whether or not the job's joblog is returned.
		Print Spooled Output
		Enabled or disabled. Specifies whether or not the spoollists of all job steps are returned.
		Print Application Log
		Enabled or disabled. Specifies whether or not the job's application log, if one was generated, is returned.
		Print Application RC
		Enabled or disabled. Specifies whether or not the job's application return codes, if they were set, are returned.
		Use Application RC
		Specifies whether or not the SAP job's application return codes will be used to determine the return code for the Universal Controller task.
Start InfoPackage	Starts the specified InfoPackage on the SAP system.	<ul> <li>InfoPackage         Name of the InfoPackage to start.     </li> <li>InfoPackage Job Name</li> </ul>
		Name of the SAP batch job that processes the InfoPackage request.
		<ul> <li>Wait         Specifies whether the Controller should wait for the SAP InfoPackage to complete processing.     </li> </ul>

Wait	Reconnects to a started job and monitors it through completion.	<ul> <li>SAP Job Name Job name of the SAP job. Variables supported.</li> <li>SAP Job ID Job ID of the SAP job. Variables supported.</li> <li>Print Job Log Enabled or disabled. Specifies whether or not the job's joblog is returned.</li> <li>Print Spooled Output Enabled or disabled. Specifies whether or not the spoollists of all job steps are returned.</li> <li>Print Application Log Enabled or disabled. Specifies whether or not the job's application log, if one was generated, is returned.</li> <li>Print Application RC Enabled or disabled. Specifies whether or not the job's application return codes, if they were set, are returned.</li> <li>Use Application RC Specifies whether or not the SAP job's application return codes will be used to determine the return code for the Universal Controller task.</li> </ul>
Wait Process Chain	Waits for a Process Chain to complete.	<ul> <li>Chain ID         ID of process chain to be monitored to completion.     </li> <li>Log ID         Log ID for process chain instance to be monitored to completion.     </li> </ul>
Wait InfoPackage	Waits for an InfoPackage to complete.	Request ID  Request ID of the InfoPackage that is to be monitored.

Abort Chair	Cancels a running SAP job.	<ul> <li>SAP Job Name Job name of the SAP job. Variables supported.</li> <li>SAP Job ID Job ID of the SAP job. Variables supported.</li> </ul>		
Interrupt Process Chain	Removes the specified process chain from the schedule.	Chain ID     ID of process chain that is to be interrupted.		
Purge Job	Deletes a defined SAP job, its joblog, and all of its spoollists. This command is not available on SAP 3.1 and SAP 4.0.	<ul> <li>SAP Job Name Job name of the SAP job. Variables supported.</li> <li>SAP Job ID Job ID of the SAP job. Variables supported.</li> </ul>		
Purge Variant	Deletes a variant from an SAP system.	<ul> <li>SAP ABAP Program Name         Name of the ABAP program for which the variant will be deleted.     </li> <li>SAP Variant Name         Name of the variant to be deleted.     </li> </ul>		
Raise Event	Raises the specified SAP background processing event.	<ul> <li>SAP Event Name of the event.</li> <li>SAP Event Parameter</li> <li>Optional parameter value for the event.</li> </ul>		
Display	Displays the data specified in the Display Command field. The data is written to standard output.	Display Command     One of the following:		
		Job Log	Displays the job log for a specified SAP job.	
		Spool List	Displays the spoollist for a job step.	
		Status	Displays the current status for an SAP job.	

Variants	Displays the variants available for the specified ABAP program.	
Variant	Displays the contents of a specified variant. <b>Note:</b> Requires XBP interface 2.0 or greater.	
Job Definition	Displays the definition of the specified SAP job.	
Select	Displays a variety of attributes for a list of SAP jobs that match the specified criteria.	
System Log	Displays a portion of an SAP syslog that meets the specified date/time constraints.	
Intercept Table	Displays the contents of the job intercept criteria table for the connected SAP system.	
Intercepted Jobs	Displays intercepted jobs for the connected SAP system.	
Reports	Displays a list of ABAP reports that match the specified criteria.	
Commands	Displays a list of SAP external commands that match the specified criteria.	
Output Devices	Displays a list of SAP output devices that match the specified criteria.	
Print Formats	Displays a list of print formats that are available for the specified printer.	
Selection Screen	Displays information about the selection fields of an ABAP program.	
Event History	Displays a list of events that were logged in an SAP system's event history. The retrieved events can optionally be set to "Confirmed."	
Criteria Manager Profiles	Displays a list of Criteria Manager profiles.	
Criteria Manager Criteria	Displays the criteria hierarchy of a particular profile in XML format.	
Process Chains	Displays a list of process chains from the SAP system that meet the specified criteria.	
Process Chain	Displays the list of processes contained within the specified process chain.	
Process Chain Log	Displays the SAP log associated with the process chain.	
Process Chain Start Condition	Displays the SAP start condition for specified process chain.	

		Process Chain Status	Displays the current status of the process chain.
		InfoPackages	Displays a list of InfoPackages on the SAP system that meet the specified criteria.
		InfoPackage Status	Displays the current status for the InfoPackage instance identified by the request ID.
Generate Variant Definition	Generates a USAP variant definition file based on a model SAP variant. The generated definition file is written to standard output. Requires XBP interface 2.0 or greater.	SAP ABAP Prog	
			P program in an SAP system to which the model variant belongs.
		SAP Variant Na	
		Pre-existing SAF	P variant name to use as the model variant.
Generate Job Definition	Generates a USAP job definition file based on a model SAP job. The generated definition file is written to standard output.	SAP Job Name	
		Job name of the	SAP job. Variables supported.
		SAP Job ID	
		Job ID of the SAP job. Variables supported.	
		For Utility Agents	s older than Universal Agent 6.4.2.2, this is a required field.
			a newer Utility Agent, specifying a Job ID of the target SAP job will ensure in be uniquely identified.
		If you do not spe	ecify a Job ID, one of the following applies:
		user in a  If the tar specified  •	rget SAP system has only one job with the specified name for the specified a status of scheduled, it is uniquely identified. rget SAP system has multiple jobs with the specified name for the duser:  By default, we select the scheduled job if only one exists. You can optionally add an SAP Command Option -model_status <scheduled any="" finished=""  =""> to control which SAP job status is used if only one job with the specified status exists. You also can optionally add an SAP Command Option -resolve_multi_model yes to select the latest SAP job if more than one exists.</scheduled>

Create CM Profile	Creates a new Criteria Manager profile.	<ul> <li>Script or File System         Specifies whether the USAP definition file exists in the file system of the machine where the Agent is running or in Scripts.     </li> <li>Script         Required if Script or File System = Script; Name of the script in the Controller database that will be executed by this task.     </li> </ul>
		Note If you click the Details icon for a Script selected in this field, the Script Type field in the Details is read-only.  SAP Criteria Manager XML File
		Name of the file that contains the Criteria Manager information.
		Event Select State
		Event status of the events which should be read.
		SAP Event
		Name of the event.
		SAP Event Parameter
		Optional parameter value for the event.
		Confirm Returned Events
		Specification for whether or not the status of returned events should be changed in the SAP system.

Set CM Criteria	Sets the criteria for a profile.	Script or File System
		Specifies whether the USAP definition file exists in the file system of the machine where the Agent is running or in Scripts.
		• Script
		Required if <b>Script or File System</b> = Script; Name of the script in the Controller database that will be executed by this task.
		Note If you click the Details icon for a Script selected in this field, the Script Type field in the Details is read-only.
		SAP Criteria Manager XML File
		Name of the file that contains the Criteria Manager information.
		SAP Criteria Manager Profile ID
		ID of the profile.
		SAP Criteria Manager Profile Type
		Type of profile. For the default criteria types provided by SAP, the values are:
		<ul> <li>EVTHIS - Identifies a criteria type for event history.</li> <li>EVHIRO - Identifies a criteria type for the reorganization of raised events.</li> <li>INTERC - Identifies a criteria type for job interception.</li> <li>Event Select State</li> </ul>
		Event status of the events which should be read.
		SAP Event
		Name of the event.
		SAP Event Parameter
		Optional parameter value for the event.
		Confirm Returned Events
		Specification for whether or not the status of returned events should be changed in the SAP system.

Activate CM Profile	Activates a criteria profile of the specified type.	<ul> <li>SAP Criteria Manager Profile ID         ID of the profile.     </li> <li>SAP Criteria Manager Profile Type         Type of profile. For the default criteria types provided by SAP, the values are:         <ul> <li>EVTHIS - Identifies a criteria type for event history.</li> <li>EVHIRO - Identifies a criteria type for the reorganization of raised events.</li> <li>INTERC - Identifies a criteria type for job interception.</li> </ul> </li> <li>Event Select State         <ul> <li>Event status of the events which should be read.</li> </ul> </li> </ul>
		<ul> <li>SAP Event         Name of the event.     </li> <li>SAP Event Parameter         Optional parameter value for the event.     </li> <li>Confirm Returned Events         Specification for whether or not the status of returned events should be changed in the SAP system.     </li> </ul>
Deactivate CM Profile	Deactivates a criteria profile of the specified type.	<ul> <li>SAP Criteria Manager Profile Type         Type of profile. For the default criteria types provided by SAP, the values are:         <ul> <li>EVTHIS - Identifies a criteria type for event history.</li> <li>EVHIRO - Identifies a criteria type for the reorganization of raised events.</li> <li>INTERC - Identifies a criteria type for job interception.</li> </ul> </li> <li>Event Select State         <ul> <li>Event status of the events which should be read.</li> </ul> </li> <li>SAP Event         <ul> <li>Name of the event.</li> </ul> </li> <li>SAP Event Parameter         <ul> <li>Optional parameter value for the event.</li> </ul> </li> <li>Confirm Returned Events         <ul> <li>Specification for whether or not the status of returned events should be changed in the SAP system.</li> </ul> </li> </ul>

Delete CM Profile	Deletes a criteria profile from an SAP system.	<ul> <li>SAP Criteria Manager Profile ID  ID of the profile.</li> <li>SAP Criteria Manager Profile Type  Type of profile. For the default criteria types provided by SAP, the values are:  • EVTHIS - Identifies a criteria type for event history.  • EVHIRO - Identifies a criteria type for the reorganization of raised events.  • INTERC - Identifies a criteria type for job interception.</li> <li>Event Select State  Event status of the events which should be read.</li> <li>SAP Event  Name of the event.</li> <li>SAP Event Parameter  Optional parameter value for the event.</li> <li>Confirm Returned Events</li> </ul>
		<ul> <li>Confirm Returned Events</li> <li>Specification for whether or not the status of returned events should be changed in the SAP system.</li> </ul>

## **Running an SAP Task**

You can run an SAP task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the SAP tasks list or SAP Task Details Action menu.
- As part of a workflow.
- Specify triggers that run the task automatically based on times or events.

# **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

## PeopleSoft Task

- Overview
- Before You Begin
- Built-In Variables
- Creating a PeopleSoft Task
  - PeopleSoft Task Details
  - PeopleSoft Task Details Field Descriptions
  - Options Fields
- Viewing a PeopleSoft Task Instance
  - PeopleSoft Task Instance Details
  - PeopleSoft Task Instance Details Field Descriptions
- Adding RunTime Parameters
  - Adding a Parameter
  - Deleting a RunTime Parameter
- Running a PeopleSoft Task
- Monitoring Task Execution

### Overview

#### Note

These instructions assume the user has a working knowledge of PeopleSoft.

The PeopleSoft task allows you to send commands to a PeopleSoft system and gather status information and output back from PeopleSoft. The PeopleSoft task uses Stonebranch's proprietary Universal Connector for PeopleSoft (UPPS) to communicate with PeopleSoft . Universal Connector for PeopleSoft allows Universal Controller to connect to a PeopleSoft system and manage PeopleSoft background processing tasks.

## **Before You Begin**

To run a PeopleSoft task, you must first complete the following:

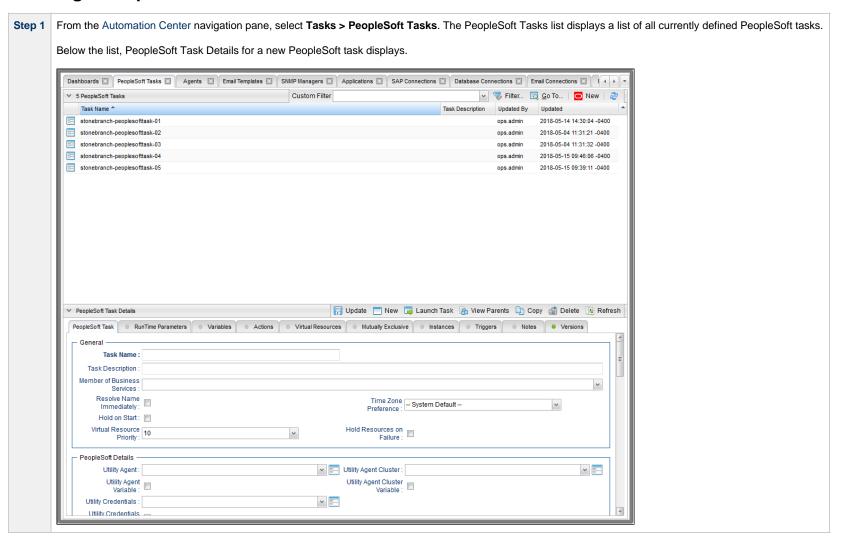

- Identify a Universal Agent for Linux/Unix that will interface with the PeopleSoft system.
- Define an PeopleSoft connection in the Controller database.

### **Built-In Variables**

The following built-in variables can be used in a PeopleSoft task to pass data where appropriate:

- Task Instance variables
- Agent-Based Task Instance variables
- PeopleSoft Task variables

## **Creating a PeopleSoft Task**

Step 2 Enter/select Details for a new PeopleSoft task, using the field descriptions below as a guide.

- Required fields display in **boldface**.
- Default values for fields, if available, display automatically.

To display more of the Details fields on the screen, you can either:

- Use the scroll bar.
- Temporarily hide the list above the Details.
- Click the **New** button above the list to display a pop-up version of the Details.

Step 3 Click a Save button. The task is added to the database, and all buttons and tabs in the Task Details are enabled.

### Note

To open an existing record on the list, either:

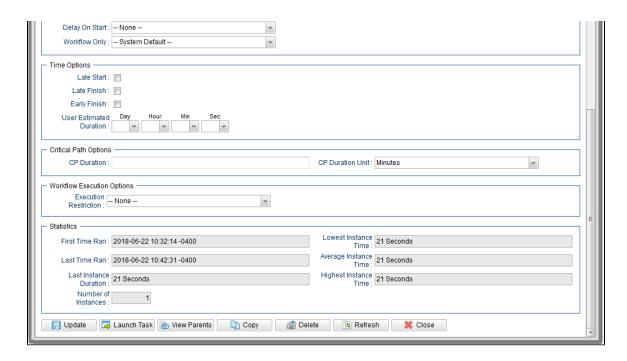

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click Open In Tab in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

## **PeopleSoft Task Details**

The following PeopleSoft Task Details is for an existing PeopleSoft task.

Depending on the values that you enter / select for these fields, and whether or not the PeopleSoft task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the PeopleSoft Task Details.

## **PeopleSoft Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the PeopleSoft Task Details.

Field Name	Description
General	This section contains general information about the task.
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.

Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.
	<ul> <li>Options:</li> <li>System Default –         Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxx)         Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.</li> <li>Inherited         Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.</li> </ul>
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.
Hold Reason	Information about why the task will be put on hold when it starts.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
PeopleSoft Details	This section contains assorted detailed information about the task.
Utility Agent	Name of the Linux/Unix or Windows Agent that will communicate with the PeopleSoft system. If you do not specify an Agent, you must specify an agent cluster.

### Utility Agent Variable

If enabled, the Utility Agent field converts from a reference field (where you browse and select a record) into a text field that allows you to enter a variable. Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

### Note

When updating multiple Tasks, to change from using a Utility Agent reference to using a Utility Agent variable, you must change the **Utility Agent Variable** field to **Yes** and specify the Utility Agent variable in the **Utility Agent Unresolved** field. Conversely, to change from using a Utility Agent variable to using a Utility Agent reference, you must change the **Utility Agent Variable** field to **No** and specify the Utility Agent reference in the **Utility Agent** field.

### Utility Agent Cluster

Group of Agents, one of which the Controller will choose to run this task. You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific Agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.

### Utility Agent Cluster Variable

Indication of whether the Utility Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Utility Agent Cluster as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Utility Agent Cluster reference to using a Utility Agent Cluster variable, you must change the **Utility Agent Cluster Variable** field to **Yes** and specify the Utility Agent Cluster variable in the **Utility Agent Cluster Unresolved** field. Conversely, to change from using a Utility Agent Cluster variable to using a Utility Agent Cluster reference, you must change the **Utility Agent Cluster Variable** field to **No** and specify the Utility Agent Cluster reference in the **Utility Agent Cluster** field.

### Utility Credentials

Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.

Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

### Utility Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials Variable** field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

# PeopleSoft Connection

Name of the PeopleSoft connection. The PeopleSoft connection specifies information about the PeopleSoft server. Select an existing PeopleSoft Connection from the drop-down list or click the icon to create a new PeopleSoft Connection.

### PeopleSoft Connection Variable

Indication of whether the PeopleSoft Connection field is a reference field for selecting a specific PeopleSoft Connection (unchecked) or a text field for specifying the #PeopleSoft Connection as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a PeopleSoft Connection reference to using a PeopleSoft Connection variable, you must change the **PeopleSoft Connection Variable** field to **Yes** and specify the PeopleSoft Connection variable in the **PeopleSoft Connection Unresolved** field. Conversely, to change from using a PeopleSoft Connection variable to using a PeopleSoft Connection reference, you must change the **PeopleSoft Connection Variable** field to **No** and specify the PeopleSoft Connection reference in the **PeopleSoft Connection** field.

### PeopleSoft Credentials

Login credentials that the Controller will use to access the PeopleSoft system. The credentials are stored in the Universal Controller credentials table; see Credentials.

#### Note

Either the PeopleSoft Connection or the PeopleSost task using that connection must specify PeopleSoft Credentials. If a PeopleSoft task using the PeopleSoft Connection specifies PeopleSoft Credentials, those PeopleSoft task credentials override the PeopleSoft Connection credentials.

### PeopleSoft Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials Variable** field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

Command	
	PeopleSoft command to execute.
	Options:
	Schedule Process     Schedule a process.
	Schedule Job
	Schedule a job.  • Run Jobset
	Run a job.
	Default is Schedule Process.
Run Control ID	If Command = Schedule Process or Schedule Job; Run control ID to be used for the process submission.
Process Type	If Command = Schedule Process or Schedule Job; Specific type of PeopleSoft process. (If Command = Schedule Job, Process Type defaults to PSJob and is read-only.)
Process/Job Name	If Command = Schedule Process or Schedule Job; Name of the PeopleSoft process/job.
Server Name	If Command = Schedule Process or Schedule Job; Specific server name. If Command = Schedule Process or Schedule Job; Specific server name.
Output Destination Type	If Command = Schedule Process or Schedule Job; Type of output for the submitted process.
Output Destination Format	If Command = Schedule Process or Schedule Job; Override of the default output format for the submitted process.
Output Destination String	If Command = Schedule Process or Schedule Job; File path or printer destination for the output.
Process File Name	If Command = Schedule Process or Schedule Job; Dependent file name.
Report Folder Name	If Command = Schedule Process or Schedule Job; Folder in which the report will be viewed in Report Manager.
Retention Days	If Command = Schedule Process or Schedule Job; Number of days that reports generated by the submitted process should be retained by the system.

Main Schedule Name	If Command = Run Jobset; Name of the jobset schedule.
Main Job Name	If Command = Run Jobset; Name of the job within the jobset schedule.
Print Distribution List	Specification for whether or not the report-recipient distribution list is included in the Job Report.
Print Parameter List	Specification for whether or not the parameter list job items are included in the Job Report.
Print Application Message	Specification for whether or not the application messages for the monitored processes are included in the Job Report.
Print System Message	Specification for whether or not the application messages for the monitored processes are included in the Job Report.
Print Job Tree	Specification for whether or not the job tree is included in the Job Report.
Report	Specification for whether or not reports associated with a process are returned.
Content Filter	Comma-delimited list of report file suffixes that will not be returned. For example: pdf,xls
Exit Code Processing	Specifies how the Controller should determine whether the executed command failed or completed successfully.  Options:  Success Exitcode Range Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field. Failure Exitcode Range Command is considered failed if its exit code falls within the range specified in the Exit Codes field. Success Output Contains Command is considered completed successfully if its output contains the text specified in the Scan Output For field. Failure Output Contains Command is considered failed if its output contains the text specified in the Scan Output For field. Step Conditions (z/OS only) Command is considered completed successfully/failed if any of its specified condition codes falls within the range specified under the Step Conditions tab (see Creating Step Conditions).

Exit Codes	Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.
Output Type	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output.  Options:  Standard Output (STDOUT) Standard Error (STDERR) File
Scan Output For	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this field as a regular expression.
Automatic Output Retrieval	Specifies whether you want the Controller to automatically retrieve any output from the job and attach it to the task instance record.  Options:  None Do not attach any output to the task instance record. Standard Output Attach all standard output. Standard Error Attach standard error output. File Attach the file specified in the Output File field. Standard Output/Error Attach all standard output and standard error output.  Note Tasks specifying Automatic Output Retrieval will fail with Start Failure if the Agent Output Prohibited field is true in the Details of the specified Agent.
Start Line	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Instructs the Controller to retrieve data beginning at the line indicated.  • If a <b>Start Line</b> value is not specified, the default is 1.  • If the <b>Start Line</b> value is <b>-1</b> , data will be retrieved starting at the end of the file.
Number of Lines	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Allows you to limit the retrieved data to the number of lines specified. If a Number of Lines value is not specified, the default is the value of the Retrieve Output Default Number Of Lines Universal Controller system property.

0	
Scan Text	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Regex pattern that the Controller will search for a match for in STDOUT/STDERR or a specified file. The Controller will include the <b>Number of Lines</b> above and below the first line matched.
	if the Regex pattern is not found, the following message is returned: OPSWISE WARNING - Scan text string not found.
Automatic Output File	If Automatic Output Retrieval = File; Output file to return automatically.
Retry Options	This section contains specifications for retrying the task.
Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval (Seconds)	User-defined; number of seconds between each retry.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:
	<ul> <li>All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.</li> </ul>
	<ul> <li>Workflow conditional path processing; any Successors waiting on a failure path will not be released.</li> </ul>
	• Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which <b>Suppress Intermediate Failures</b> has been enabled.
	Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	• - None -
	<ul><li>Time</li><li>Relative Time</li></ul>
	<ul><li>Duration</li><li>Seconds</li></ul>

Wait Day	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	<ul> <li>None <ul> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> </ul> </li> <li>Same Day <ul> <li>Do not advance day.</li> </ul> </li> <li>Next Day <ul> <li>Advance to the next day.</li> </ul> </li> <li>Next Business Day <ul> <li>Advance to the next business day.</li> </ul> </li> <li>Sunday <ul> <li>If today is not Sunday, advance to next Sunday.</li> </ul> </li> <li>Monday</li> <li>If today is not Monday, advance to next Monday.</li> </ul> <li>Tuesday <ul> <li>If today is not Tuesday, advance to next Tuesday.</li> </ul> </li> <li>Wednesday <ul> <li>If today is not Thursday, advance to next Wednesday.</li> </ul> </li> <li>Thursday <ul> <li>If today is not Thursday, advance to next Thursday.</li> </ul> </li> <li>Friday <ul> <li>If today is not Friday, advance to next Friday.</li> </ul> </li> <li>Saturday <ul> <li>If today is not Saturday, advance to next Friday.</li> </ul> </li> <li>Saturday</li> <li>If today is not Saturday, advance to next Saturday.</li>
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.
Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.

Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.  Options are:  - None -  Duration - Seconds
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  Options are:  System Default Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.) - Yes Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow No Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

### Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Dav Advance to a specific number of days in the future. Default is - None --. Late Start Nth Amount If Late Start Day Constraint = Nth Day; Number of days to advance. Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Required if Late Finish is enabled.
Options:
<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.
Valid values:
<ul> <li> None         Advance to the next day if the specified late finish time is before the Created time of the task instance.</li> <li>Same Day</li> </ul>
Do not advance day.  • Next Day
Advance to the next day.  • Next Business Day Advance to the next business day.
<ul> <li>Sunday         If today is not Sunday, advance to next Sunday.     </li> <li>Monday</li> </ul>
If today is not Monday, advance to next Monday.  Tuesday If today is not Tuesday, advance to next Tuesday.
Wednesday     If today is not Wednesday, advance to next Wednesday.
<ul> <li>Thursday         If today is not Thursday, advance to next Thursday.     </li> <li>Friday</li> </ul>
If today is not Friday, advance to next Friday.  • Saturday If today is not Saturday, advance to next Saturday.
Nth Day     Advance to a specific number of days in the future.
Default is – None
If Late Finish Day Constraint = Nth Day; Number of days to advance.
If Late Finish Type = Duration; Longest amount of time this task instance should take to run.

Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Early Finish Type	Required if Early Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes before the specified time (see Early Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.</li> </ul>
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.
	Valid values:
	<ul> <li> None</li> <li>Advance to the next day if the specified early finish time is before the Created time of the task instance.</li> </ul>
	Same Day
	Do not advance day.  • Next Day
	Advance to the next day.
	<ul> <li>Next Business Day         Advance to the next business day.     </li> </ul>
	<ul> <li>Sunday</li> <li>If today is not Sunday, advance to next Sunday.</li> </ul>
	Monday
	If today is not Monday, advance to next Monday.  • Tuesday
	If today is not Tuesday, advance to next Tuesday.  • Wednesday
	If today is not Wednesday, advance to next Wednesday.
	<ul> <li>Thursday         If today is not Thursday, advance to next Thursday.     </li> </ul>
	<ul> <li>Friday         If today is not Friday, advance to next Friday.     </li> </ul>
	Saturday
	If today is not Saturday, advance to next Saturday.  Nth Day Advance to a specific number of days in the future.
	Default is – None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.

Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds  Minutes  Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.

# Execution Restriction Specification for whether or not there is a restriction for this task to be run, skipped, or held. Options are: -- None -- No restriction for this task. • Run Restriction for when this task will be run. • Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held. If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow. Restriction Period If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted. Options are: None – No period of restriction for this task. Restriction is valid if the date is before the Before Date value. Restriction is valid if the date is after the After Date value. Restriction is valid if the date is before the Before Date value and after After Date value. On Restriction is valid if the date is one of the Date List values. Before Date If Restriction Period = Before or Span; Date before which the restriction is valid. Before Time If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid. After Date If Restriction Period = After or Span; Date after which the restriction is valid. After Time If Restriction Period = After or Span; Time on the selected date after which the restriction is valid. Date List If Restriction Period = On; Date(s) on which the restriction is valid. **Statistics** This section contains time-related statistics for task instances of the task.

First Time Ran	System-supplied; date and time this task first ran.
Last Time Ran	System-supplied; date and time the task last ran.
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.
Lowest Instance Time	System-supplied; shortest amount of time this task has taken to run.
Average Instance Time	System-supplied; average amount of time this task takes to run.
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.
Number of Instances	System-supplied; number of instances in the database for this task.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Buttons	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Save	Saves a new task record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new task.
Update	Saves updates to the record.

Launch Task	Manually launches the task.
View Parents	Displays a list of any parent Workflow tasks for this task.
Сору	Creates a copy of this task, which you are prompted to rename.
Delete	Deletes the current record.
	<ul> <li>Note         You cannot delete a task if it is either:         <ul> <li>Specified in an enabled Trigger.</li> <li>The only task specified in a disabled Trigger.</li> </ul> </li> </ul>
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task.
Tabs	This section identifies the tabs across the top of the Task Details that provide access to additional information about the task instance.
RunTime Parameters	See Adding RunTime Parameters, below.
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.

## **Actions** Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task. Events are: Task instance status Exit codes Late start • Late finish Early finish Actions are: Abort the task if certain events occur. For details, see Abort Actions. **Abort Action** Send an email if certain events occur. For details, see Email Notification Actions. **Email Notification Set Variable** Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow. **SNMP** Send an email if certain events occur. For details, see SNMP Notification Actions. **Notification** Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions. **System** Operation Virtual Lists all Virtual Resources to which this task is assigned. Resources Mutually Lists all tasks that have been set to be mutually exclusive of this task. **Exclusive** Lists all instances of the task. Instances **Triggers** List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current task name>#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers. Notes Lists all notes associated with this record. Versions Stores copies of all previous versions of the current record. See Record Versioning.

## **Options Fields**

Five PeopleSoft Task fields allow you to populate their drop-down lists with options retrieved from the PeopleSoft system:

- Process Type
- Process/Job Name
- Server Name
- Output Destination Type
- Output Destination Format

To select the options for a field, click the refresh picker icon next to its drop-down list to display a Refresh Options... dialog. There is a different Refresh Options... dialog for each options field (see below).

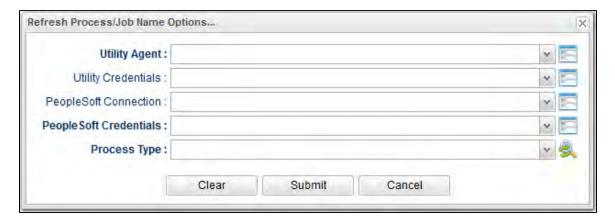

Most of the fields on a Refresh Options... dialog are fields from the PeopleSoft Task Details, and the values for those fields in the dialog are, by default, the same as the values for the fields in the Details. You can keep the current values or change them from their drop-down lists.

When you click the Submit button on the Refresh Options... dialog for an options field, the drop-down list for that field is populated with values that are determined by the values that you submitted on the Refresh Options... dialog.

## **Process Type**

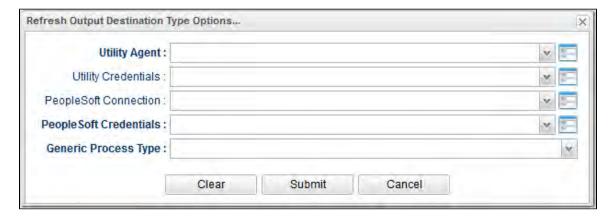

## **Process/Job Name**

## **Server Name**

## **Output Destination Type**

**Output Destination Format** 

# **Viewing a PeopleSoft Task Instance**

When a PeopleSoft task is launched, the Controller creates a task instance record of that task.

A task instance contains detailed information about a single execution of that task.

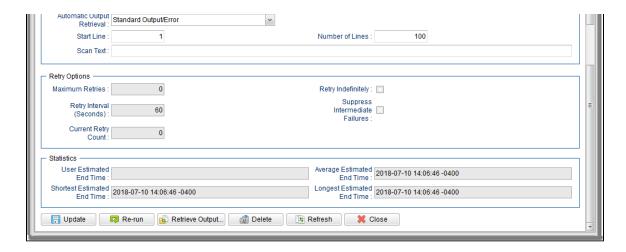

You can access a task instance from:

- Instances tab on the PeopleSoft Task Details for that task
- Activity Monitor
- Task Instances list

# **PeopleSoft Task Instance Details**

The following PeopleSoft Task Instance Details contains information on the execution of the task shown in the PeopleSoft Task Details.

# **PeopleSoft Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in PeopleSoft Task Instance Details.

Field Name	Description
General	This section contains general information about the task instance.
Instance Name	Name of this task instance.
Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.
Invoked by	System-supplied; how the task instance was launched.  Options:  Trigger: (Trigger Name)     Instance was launched by the named trigger.  Workflow: (Workflow Name)     Instance was launched by the named workflow.  Manually Launched     Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.

Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited. Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server. Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).
Status Description	System-supplied; additional information, if any, about the status of the task instance.

Operational Memo	User-defined operational memo.
Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.
End Time	System-supplied; Date and time the task instance completed.
Duration	System-supplied; amount of time the task instance took to run.
Run Status	Status of the PeopleSoft process being monitored on the PeopleSoft Process Scheduler
Distribution Status	Displays the distribution status for reports associated with the main (parent) process being monitored on the PeopleSoft system.
Process Instance	The Instance ID (generated by the PeopleSoft system) associated with the process being monitored on the PeopleSoft system.
PeopleSoft Details	This section contains assorted detailed information about the task.
Utility Agent	Name of the Linux/Unix or Windows Agent that will communicate with the PeopleSoft system. If you do not specify an Agent, you must specify an agent cluster.

#### Utility Agent Variable

If enabled, the Utility Agent field converts from a reference field (where you browse and select a record) into a text field that allows you to enter a variable. Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Utility Agent reference to using a Utility Agent variable, you must change the **Utility Agent Variable** field to **Yes** and specify the Utility Agent variable in the **Utility Agent Unresolved** field. Conversely, to change from using a Utility Agent variable to using a Utility Agent reference, you must change the **Utility Agent Variable** field to **No** and specify the Utility Agent reference in the **Utility Agent** field.

## Utility Agent Cluster

Group of Agents, one of which the Controller will choose to run this task. You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific Agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.

## Utility Agent Cluster Variable

Indication of whether the Utility Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Utility Agent Cluster as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Utility Agent Cluster reference to using a Utility Agent Cluster variable, you must change the **Utility Agent Cluster Variable** field to **Yes** and specify the Utility Agent Cluster variable in the **Utility Agent Cluster Unresolved** field. Conversely, to change from using a Utility Agent Cluster variable to using a Utility Agent Cluster variable field to **No** and specify the Utility Agent Cluster reference in the **Utility Agent Cluster** field.

#### Utility Credentials

Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.

Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

## Utility Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

## Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials Variable** field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

# PeopleSoft Connection

Name of the PeopleSoft connection. The PeopleSoft connection specifies information about the PeopleSoft server. Select an existing PeopleSoft Connection from the drop-down list or click the icon to create a new PeopleSoft Connection.

## PeopleSoft Connection Variable

Indication of whether the PeopleSoft Connection field is a reference field for selecting a specific PeopleSoft Connection (unchecked) or a text field for specifying the #PeopleSoft Connection as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a PeopleSoft Connection reference to using a PeopleSoft Connection variable, you must change the **PeopleSoft Connection Variable** field to **Yes** and specify the PeopleSoft Connection variable in the **PeopleSoft Connection Unresolved** field. Conversely, to change from using a PeopleSoft Connection variable to using a PeopleSoft Connection reference, you must change the **PeopleSoft Connection Variable** field to **No** and specify the PeopleSoft Connection reference in the **PeopleSoft Connection** field.

## PeopleSoft Credentials

Login credentials that the Controller will use to access the PeopleSoft system. The credentials are stored in the Universal Controller credentials table; see Credentials.

#### Note

Either the PeopleSoft Connection or the PeopleSoft task using that connection must specify PeopleSoft Credentials. If a PeopleSoft task using the PeopleSoft Connection specifies PeopleSoft Credentials, those PeopleSoft task credentials override the PeopleSoft Connection credentials.

## PeopleSoft Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials Variable** field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

Command	
	PeopleSoft command to execute.
	Options:
	<ul> <li>Schedule Process</li> <li>Schedule a process.</li> </ul>
	Schedule Job     Schedule a job.
	Run Jobset
	Run a job.
	Default is Schedule Process.
Run Control ID	If Command = Schedule Process or Schedule Job; Run control ID to be used for the process submission.
Process Type	If Command = Schedule Process or Schedule Job; Specific type of PeopleSoft process. (If Command = Schedule Job, Process Type defaults to PSJob and is read-only.)
Process/Job Name	If Command = Schedule Process or Schedule Job; Name of the PeopleSoft process/job.
Server Name	If Command = Schedule Process or Schedule Job; Specific server name. If Command = Schedule Process or Schedule Job; Specific server name.
Output Destination Type	If Command = Schedule Process or Schedule Job; Type of output for the submitted process.
Output Destination Format	If Command = Schedule Process or Schedule Job; Override of the default output format for the submitted process.
Output Destination String	If Command = Schedule Process or Schedule Job; File path or printer destination for the output.
Process File Name	If Command = Schedule Process or Schedule Job; Dependent file name.
Report Folder Name	If Command = Schedule Process or Schedule Job; Folder in which the report will be viewed in Report Manager.
Retention Days	If Command = Schedule Process or Schedule Job; Number of days that reports generated by the submitted process should be retained by the system.

Main Schedule Name	If Command = Run Jobset; Name of the jobset schedule.
Main Job Name	If Command = Run Jobset; Name of the job within the jobset schedule.
Print Distribution List	Specification for whether or not the report-recipient distribution list is included in the Job Report.
Print Parameter List	Specification for whether or not the parameter list job items are included in the Job Report.
Print Application Message	Specification for whether or not the application messages for the monitored processes are included in the Job Report.
Print System Message	Specification for whether or not the application messages for the monitored processes are included in the Job Report.
Print Job Tree	Specification for whether or not the job tree is included in the Job Report.
Report	Specification for whether or not reports associated with a process are returned.
Content Filter	Comma-delimited list of report file suffixes that will not be returned. For example: pdf,xls
Exit Code Processing	Specifies how the Controller should determine whether the executed command failed or completed successfully.  Options:  Success Exitcode Range Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field. Failure Exitcode Range Command is considered failed if its exit code falls within the range specified in the Exit Codes field. Success Output Contains Command is considered completed successfully if its output contains the text specified in the Scan Output For field. Failure Output Contains Command is considered failed if its output contains the text specified in the Scan Output For field. Step Conditions (z/OS only) Command is considered completed successfully/failed if any of its specified condition codes falls within the range specified under the Step Conditions tab (see Creating Step Conditions).

# Exit Codes Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30. Output Type Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output. Options: Standard Output (STDOUT) Standard Error (STDERR) File Scan Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this Output For field as a regular expression. Automatic Specifies whether you want the Controller to automatically retrieve any output from the job and attach it to the task instance record. Output Retrieval Options: None Do not attach any output to the task instance record. Standard Output Attach all standard output. Standard Error Attach standard error output. Attach the file specified in the Output File field. Standard Output/Error Attach all standard output and standard error output. Tasks specifying Automatic Output Retrieval will fail with Start Failure if the Agent Output Prohibited field is true in the Details of the specified Agent. Start Line If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Instructs the Controller to retrieve data beginning at the line indicated. • If a **Start Line** value is not specified, the default is 1. • If the **Start Line** value is **-1**, data will be retrieved starting at the end of the file. Number of Lines If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Allows you to limit the retrieved data to the number of lines specified. If a Number of Lines value is not specified, the default is the value of the Retrieve Output Default Number Of Lines Universal Controller system property.

Scan Text	If Automatic Output Retrieval = Standard Output, Standard Error, File, or Standard Output/Error; Regex pattern that the Controller will search for a match for in STDOUT/STDERR or a specified file. The Controller will include the <b>Number of Lines</b> above and below the first line matched.  if the Regex pattern is not found, the following message is returned: OPSWISE WARNING - Scan text string not found.
Automatic Output File	If Automatic Output Retrieval = File; Output file to return automatically.
Retry Options	This section contains specifications for retrying the task.
Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval (Seconds)	User-defined; number of seconds between each retry.
Current Retry Count	System-supplied; current number of times that the Controller has retried the task after it first went to failure status.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:  • All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.  • Workflow conditional path processing; any Successors waiting on a failure path will not be released.  • Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which Suppress Intermediate Failures has been enabled.
	<ul> <li>Any Workflow containing the Failed task instance will not transition to the Running/Problems status.</li> </ul>
Next Retry Time	System-supplied for a task instance in the Failed status that is scheduled for automatic retry; Next time that a retry will be made. If a task instance is not scheduled for automatic retry, Next Retry Time does not display in the task instance Details.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.

Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	<ul><li>None –</li><li>Time</li></ul>
	<ul> <li>Relative Time</li> <li>Duration</li> <li>Seconds</li> </ul>
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	<ul> <li> None</li> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> <li>Same Day</li></ul>
	If today is not Monday, advance to next Monday.  Tuesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Wednesday, advance to next Wednesday.  Thursday If today is not Thursday, advance to next Thursday.  Friday If today is not Friday, advance to next Friday.  Saturday If today is not Saturday, advance to next Saturday.
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.

Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.  Options are:  - None -  Duration Seconds
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Time Options	This section contains time-related specifications for the task instance.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

## Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Dav Advance to a specific number of days in the future. Default is - None --. Late Start Nth Amount If Late Start Day Constraint = Nth Day; Number of days to advance. Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None     Advance to the next day if the specified late finish time is before the Created time of the task instance. • Same Day     Do not advance day. • Next Day     Advance to the next day. • Next Business Day     Advance to the next business day. • Sunday     If today is not Sunday, advance to next Sunday. • Monday     If today is not Monday, advance to next Monday. • Tuesday     If today is not Tuesday, advance to next Tuesday. • Wednesday     If today is not the Medsady, advance to next Wednesday. • Thursday     If today is not Thursday, advance to next Wednesday. • Thursday     If today is not Thursday, advance to next Friday. • Saturday     If today is not Saturday, advance to next Saturday. • Nith Day     Advance to a specific number of days in the future.  Default is - None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:
	<ul> <li>Time - Flag the task if it finishes before the specified time (see Early Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.</li> </ul>
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

## Early Finish Day If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day. Constraint Valid values: -- None --Advance to the next day if the specified early finish time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future. Default is - None --. Early Finish If Early Finish Day Constraint = Nth Day; Number of days to advance. Nth Amount Early Finish If Early Finish Type = Duration; Shortest amount of time this task instance should take to run. Duration This section contains Critical Path-related specifications for the task. Critical Path **Options CP** Duration Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.

# CP Duration (Resolved)

Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.

## CP Duration Unit

Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select **Minutes** in this field.

#### Options:

- Seconds
- Minutes
- Hours

#### Default is Minutes.

# Workflow Execution Options

This section contains Execution Restriction specifications for the task if it is within a Workflow.

# Execution Restriction

Specification for whether or not there is a restriction for this task to be run, skipped, or held.

#### Options are:

- -- None -- No restriction for this task.
- Run Restriction for when this task will be run.
- Skip Restriction for when this task will be skipped.
- Hold Restriction for when this task will be held.

If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

## Restriction Period

If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.

#### Options are:

- None
  - No period of restriction for this task.
- Before
  - Restriction is valid if the date is before the Before Date value.
- After
  - Restriction is valid if the date is after the After Date value.
- Span
- Restriction is valid if the date is before the Before Date value and after After Date value.
- On

Restriction is valid if the date is one of the Date List values.

Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instance.
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Status History	History of all statuses that the task instance has gone through.

Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.
Update	Saves updates to the record.
Force Finish	See Force Finishing a Task.
Hold	Places the task instance on Hold (see Putting a Task on Hold).
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.
Re-run	See Re-running a Task.
View Parent	Displays the task instance Details for the parent Workflow of this task instance.
Retrieve Output	See Retrieving Output.
Delete	Deletes the current record.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task instance.
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.
RunTime Parameters	See Adding RunTime Parameters, below.
Virtual Resources	Lists all Virtual Resources to which this task is assigned.
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.
Output	Displays output generated from the process, if any, based on specifications provided by the user in the Automatic Output Retrieval fields in the task Details.  If automatic output retrieval was not available or was not selected, output can be obtained by clicking the Retrieve Output button.

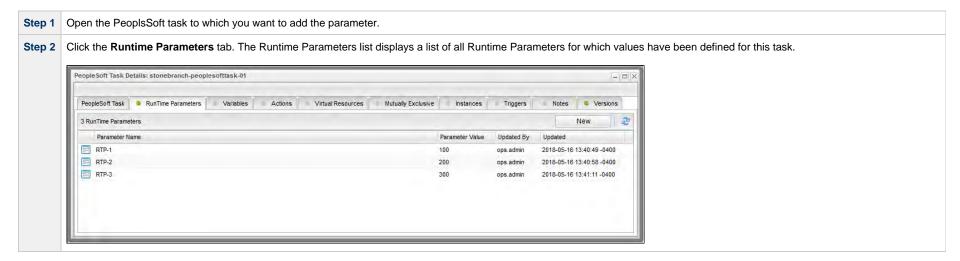

Notes

Lists all notes associated with this record.

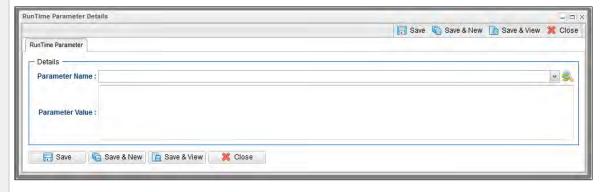

# **Adding RunTime Parameters**

You can add one or more RunTime Parameters for each PeopleSoft task, and define the values for those parameters, as described below.

# **Adding a Parameter**

**Step 3** Click the **New** button to display RunTime Parameter Details.

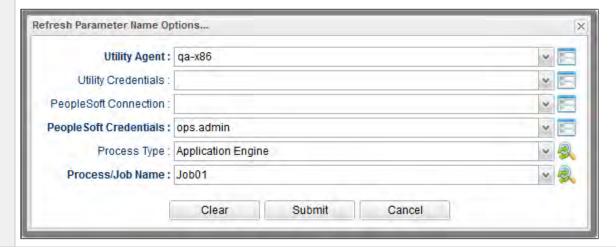

▲

## Note

If the Command field in the PeopleSoft Details specifies Schedule Job, the RunTime Parameter Details also requires you to select a Process Name and Process Type.

Step 4 Click the refresh picker icon next to the Parameter Name field to select options for the RunTime Parameter.

Step 5 For each field on the Refresh Parameter Name Options... dialog, you can select from a list of values that may have changed since the last time that a value was selected.

Most of the fields on a Refresh Options... dialog are fields from the PeopleSoft Task Details, and the values for those fields in the dialog are, by default, the same as the values for the fields in the Details. You can keep the current values or change them from their drop-down lists.

When you click the Submit button on the Refresh Parameter Name Options... dialog, the drop-down list for the **Parameter Name** field in the RunTime Parameter Details is populated with values that are determined by the values that you submitted on the Refresh Parameter Name Options... dialog.

**Step 6** Select a parameter from the drop-down list and enter a **Parameter Value**.

Step 7 Click the Save button.

## **Deleting a RunTime Parameter**

To delete a single RunTime Parameter for a task, either:

- Right-click the parameter on the RunTime Parameters list and click Delete on the Action menu.
- Open the RunTime Parameter record and click the **Delete** button.

## Running a PeopleSoft Task

You can run a PeopleSoft task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the PeopleSoft tasks list or PeopleSoft Task Details Action menu.
- As part of a workflow.
- Specify triggers that run the task automatically based on times or events.

# **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

## **File Transfer Task**

- Specifying When a Task Runs
- Running a File Transfer Task
- Monitoring Task Execution
- Code Pages

## Overview

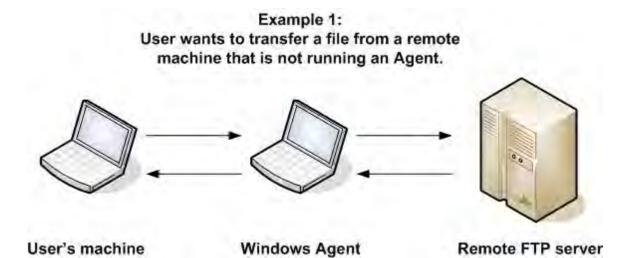

The File Transfer task allows you to execute file transfers on remote machines using any of the following protocols:

- FTP
- SFTP
- UDM
- FTPS

To run a File Transfer task, you need Universal Agent for Linux/Unix, z/OS, or Windows to communicate with the File Transfer server. The Agent can, but does not have to be, running on the same machine as the File Transfer server.

The following examples provide sample configurations for executing file transfers using a File Transfer task.

In the first example, the user wants to transfer a file from a remote File Transfer Server on a machine that does not have an Agent running on it. In this case, the File Transfer task definition provides an address and login credentials for the machine where the Agent is running as well as address and login credentials for the machine where the File Transfer server is running.

In the second example, the user wants to transfer a file from a remote File Transfer Server on a z/OS machine that does have an Agent running on it. In this case, the login credentials for the Agent machine and the File Transfer server machine are the same.

User's machine

Example 2:
User wants to transfer a file from a remote machine that is running an Agent.

Remote FTP server with z/OS Agent

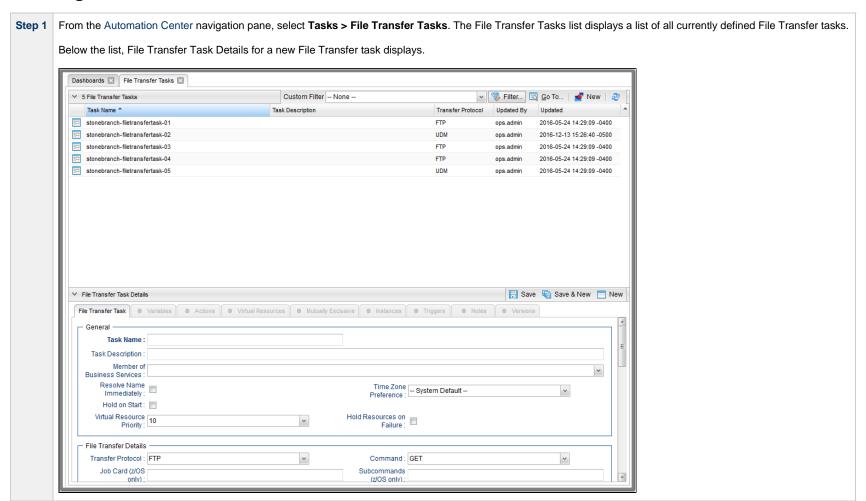

## **Built-In Variables**

The following built-in variables can be used in a File Transfer task to pass data where appropriate:

Task Instance variables

- Agent-Based Task Instance variablesFile Transfer Task variables

# **Creating a File Transfer Task**

Step 2 Enter/select Details for a new File Transfer task, using the field descriptions below as a guide.

- · Required fields display in boldface.
- Default values for fields, if available, display automatically.

To display more of the Details fields on the screen, you can either:

- Use the scroll bar.
- · Temporarily hide the list above the Details.
- Click the **New** button above the list to display a pop-up version of the Details.

Step 3 Click a Save button. The task is added to the database, and all buttons and tabs in the Task Details are enabled.

#### Note

To open an existing record on the list, either:

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click Open in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click **Open In Tab** in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

## **File Transfer Protocols**

When you create a File Transfer task, you select a file transfer protocol: FTP, SFTP, UDM, or FTPS.

The Details for FTP, SFTP, and FTPS transfer protocols are the same: the Details for the UDM transfer protocol differs considerably.

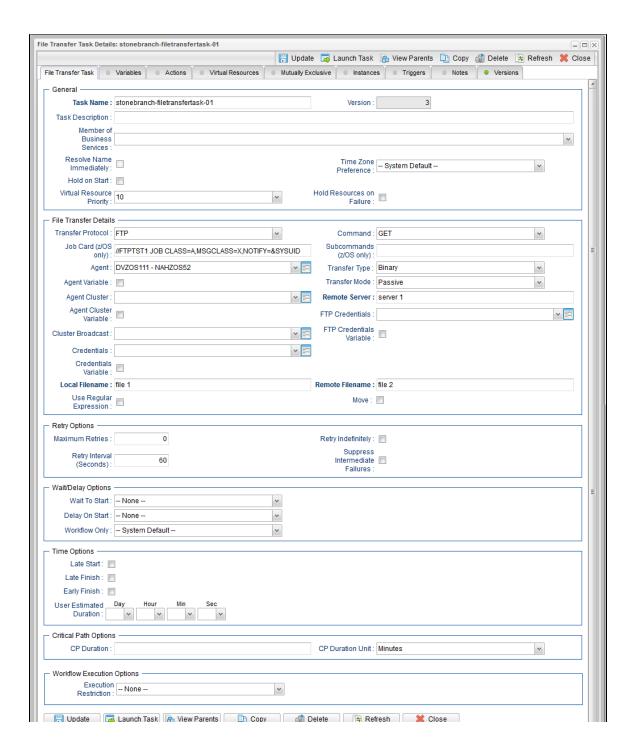

Using SFTP requires that you supply a valid credential that specifies the location of the SSL Private key on your Agent. In the Credentials Details, you supply the location for the private key in the field "Key Location (File Transfer only)". This location must exist on the Agent where you intend to run the SFTP task.

Make sure you have your private/public keys properly set up and working before you configure the Controller to use it. For example, to validate the keys, log into your destination server from your agent server using ssh.

## FTP/SFTP/FTPS File Transfer Task Details

The following FTP/SFTP/FTPS File Transfer Task Details is for an existing FTP/SFTP/FTPS File Transfer task.

Depending on the values that you enter / select for these fields, and whether or not the FTP/SFTP/FTPS File Transfer task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the FTP/SFTP/FTPS File Transfer Task Details.

# FTP/SFTP/FTPS File Transfer Task Details Field Descriptions

The following table describes the fields, buttons, and tabs that display in FTP/SFTP/FTPS File Transfer Task Details.

Field Name	Description
General	This section contains general information about the task.
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default –  Time zone is besed on the value of the Task Timezone Breference Universal Controller system property. Server or lebested
	<ul> <li>Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxx)</li> <li>Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.</li> <li>Inherited</li> <li>Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.</li> </ul>
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.
Hold Reason	Information about why the task will be put on hold when it starts.

Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
File Transfer Details	This section contains assorted detailed information about the task.
Transfer Protocol	Type of transfer protocol for this file transfer.  Options:  • FTP • SFTP • UDM • FTPS
Command	File Transfer command being executed.  Options:  GET - Copies a remote file to the local computer. PUT - Copies a local file to the remote computer. MGET - Copies multiple remote files to the local computer. MPUT - Copies multiple local files to the remote computer. MPUT - Copies multiple local files to the remote computer. DELETE - Deletes the specified file from the remote computer. MDELETE - Deletes the specified file(s) from the remote computer. MKDIR - Creates the specified directory on the remote computer. RMDIR - Removes the specified directory from the remote computer.
Job Card (z/OS only)	For z/OS, the job card information for the JCL statement. Example:  //File TransferJOB01 JOB (File Transfer,001), FANNY, MSGCLASS=X, MSGLEVEL=(1,1), NOTIFY=&SYSUID, CLASS=A
Subcommands (z/OS only)	For z/OS, any subcommands used in the JCL statement.

# Agent Name of the Agent resource that identifies the machine where the operation will run. If you do not specify an Agent, you must specify an Agent Cluster. Agent Variable Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions. Note When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the Agent Variable field to Yes and specify the Agent variable in the Agent Unresolved field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the Agent Variable field to No and specify the Agent reference in the Agent field. Transfer Type Data format of the file being transferred. Options: Binary ASCII Transfer Mode If Transfer Protocol is FTP or FTPS: Transfer mode. Options: Active Passive Extended Passive Agent Cluster Group of Agents, one of which the Controller will choose to run this task (compare with Cluster Broadcast). You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information. Agent Cluster Variable Indication of whether the Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Agent Cluster as a variable (checked). Use the format: \$(variable name). The variable must be a supported type as described in Variables and Functions. Note When updating multiple Tasks, to change from using an Agent Cluster reference to using an Agent Cluster variable, you must change the Agent Cluster Variable field to Yes and specify the Agent Cluster variable in the Agent Cluster Unresolved field. Conversely, to change from using an Agent Cluster variable to using an Agent Cluster reference, you must change the Agent Cluster Variable field to No and specify the Agent Cluster reference in the Agent Cluster field.

Cluster Broadcast	Group of Agents, all of which will run this task (compare with Agent Cluster). You can specify a Cluster Broadcast in place of a specific Agent and/or agent cluster. Each instance of the task running on its own Agent becomes a separate task instance record in the database and displays separately on the Activity Monitor.
Remote Server	Required if Transfer Protocol = FTP, SFTP or FTPS; name or IP address of the File Transfer server. This machine may or may not be the same as the Agent machine.  You also can specify a non-standard FTP, SFTP, or FTPS port: port number separated from the host name with a colon: "some.server.com:2222".
FTP Credentials	Login credentials that the Agent will use to access the FTP or SFTP server machine. If the File Transfer server and Agent are running on the same machine, enter the same credentials as those you entered in the Credentials field.
FTP Credentials Variable	Indication of whether the FTP Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the FTP Credentials as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using an FTP Credentials reference to using an FTP Credentials variable, you must change the FTP Credentials Variable field to Yes and specify the FTP Credentials variable in the FTP Credentials Unresolved field. Conversely, to change from using an FTP Credentials variable to using an FTP Credentials reference, you must change the FTP Credentials Variable field to No and specify the FTP Credentials reference in the FTP Credentials field.
Credentials	Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.  Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.
Credentials Variable	Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the Credentials Variable field to Yes and specify the Credentials variable in the Credentials Unresolved field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the Credentials Variable field to No and specify the Credentials reference in the Credentials field.
Local Filename	Required if Transfer Type = FTP or SFTP; path and file name on the local server. That is, the "transfer from" file name.
Use Regular Expression	Enables the use of a regular expression in the Local Filename field.

Remote Filename	Required if Transfer Type = FTP or SFTP; path and file name on the remote server. That is, the "transfer to" file name.
Move	If Transfer Protocol = FTP, SFTP, or FTPS, and Command = GET, MGET, PUT, or MPUT; Modifies the behavior of GET/MGET and PUT/MPUT by deleting the source file(s) after being transferred to the destination.
	GET/MGET with Move enabled will delete the files from the remote FTP server; PUT/MPUT with Move enabled will delete the files from the local FTP client.
<b>Retry Options</b>	This section contains specifications for retrying the task.
Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval (Seconds)	User-defined; number of seconds between each retry.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:  • All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.  • Workflow conditional path processing; any Successors waiting on a failure path will not be released.
	• Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which <b>Suppress Intermediate Failures</b> has been enabled.
	<ul> <li>Any Workflow containing the Failed task instance will not transition to the Running/Problems status.</li> </ul>
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.  Options are:
	<ul> <li>- None -</li> <li>Time</li> <li>Relative Time</li> <li>Duration</li> <li>Seconds</li> </ul>

Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	<ul> <li>None</li> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> <li>Same Day Do not advance day. Next Day Advance to the next day. </li> <li>Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Tuesday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Wednesday. Thursday If today is not Wednesday, advance to next Hursday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. </li> </ul>
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.
Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.

Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.  Options are:  - None -  Duration Seconds
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  Options are:  System Default     Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.)  Yes     Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  No     Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start	

Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
	Valid values:
	<ul> <li> None Advance to the next day if the specified late start time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday</li> </ul>
	If today is not Tuesday, advance to next Tuesday.  • Wednesday If today is not Wednesday, advance to next Wednesday.  • Thursday
	<ul> <li>If today is not Thursday, advance to next Thursday.</li> <li>Friday</li> <li>If today is not Friday, advance to next Friday.</li> <li>Saturday</li> <li>If today is not Saturday, advance to next Saturday.</li> <li>Nth Day</li> </ul>
	Advance to a specific number of days in the future.  Default is – None
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.
	For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.
	For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Late Finish	
уре	Required if Late Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
ate Finish	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
ate Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.
	Valid values:
	<ul> <li> None Advance to the next day if the specified late finish time is before the Created time of the task instance.</li> </ul>
	<ul> <li>Same Day</li> </ul>
	Do not advance day.  • Next Day
	Advance to the next day.
	<ul> <li>Next Business Day         Advance to the next business day.     </li> </ul>
	Sunday
	If today is not Sunday, advance to next Sunday.  • Monday
	If today is not Monday, advance to next Monday.
	<ul> <li>Tuesday         If today is not Tuesday, advance to next Tuesday.     </li> </ul>
	Wednesday     If today is not Wednesday, advance to next Wednesday.
	Thursday
	If today is not Thursday, advance to next Thursday.  • Friday
	If today is not Friday, advance to next Friday.
	<ul> <li>Saturday         If today is not Saturday, advance to next Saturday.     </li> </ul>
	Nth Day
	Advance to a specific number of days in the future.
	Default is – None
ate Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.
ate Finish Ouration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.

Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Early Finish Type	Required if Early Finish is enabled.  Options:
	<ul> <li>Time - Flag the task if it finishes before the specified time (see Early Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.</li> </ul>
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  • None

Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds Minutes Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.

Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.
	Options are:
	<ul> <li> None No restriction for this task.</li> <li>Run Restriction for when this task will be run.</li> <li>Skip Restriction for when this task will be skipped.</li> <li>Hold Restriction for when this task will be held.</li> </ul>
	If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.
Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.
	Options are:
	<ul> <li>None – No period of restriction for this task.</li> <li>Before Restriction is valid if the date is before the Before Date value.</li> <li>After Restriction is valid if the date is after the After Date value.</li> </ul>
	<ul> <li>Span Restriction is valid if the date is before the Before Date value and after After Date value.</li> <li>On Restriction is valid if the date is one of the Date List values.</li> </ul>
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for task instances of the task.

First Time Ran	System-supplied; date and time this task first ran.
Last Time Ran	System-supplied; date and time the task last ran.
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.
Lowest Instance Time	System-supplied; shortest amount of time this task has taken to run.
Average Instance Time	System-supplied; average amount of time this task takes to run.
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.
Number of Instances	System-supplied; number of instances in the database for this task.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Buttons	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Save	Saves a new task record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new task.
Update	Saves updates to the record.
Launch Task	Manually launches the task.

View Parents	Displays a list of any parent Workflow tasks for this task.
Сору	Creates a copy of this task, which you are prompted to rename.
Delete	Deletes the current record.
	<ul> <li>Note         You cannot delete a task if it is either:         <ul> <li>Specified in an enabled Trigger.</li> <li>The only task specified in a disabled Trigger.</li> </ul> </li> </ul>
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task.
Tabs	This section identifies the tabs across the top of the Task Details that provide access to additional information about the task.
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.

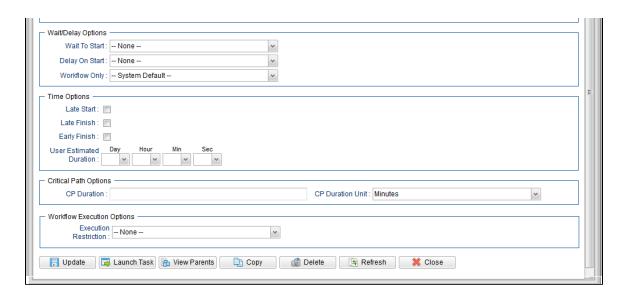

### Actions Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task. Events are: Task instance status Exit codes Late start · Late finish Early finish Actions are: Abort the task if certain events occur. For details, see Abort Actions. **Abort Action** Send an email if certain events occur. For details, see Email Notification Actions. Email Notification Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Set Variable Workflow. SNMP Send an email if certain events occur. For details, see SNMP Notification Actions. Notification System Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions. Operation Virtual Lists all Virtual Resources to which this task is assigned. Resources Mutually Lists all tasks that have been set to be mutually exclusive of this task. **Exclusive** Lists all instances of the task. Instances **Triggers** List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current task name>#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers. Notes Lists all notes associated with this record. Versions Stores copies of all previous versions of the current record. See Record Versioning.

### **UDM File Transfer Task Details**

The following UDM File Transfer Task Details is for an existing UDM File Transfer task.

Depending on the values that you enter / select for these fields, and whether or not the UDM File Transfer task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the UDM File Transfer Task Details.

# **UDM File Transfer Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in UDM File Transfer Task Details.

Field Name	Description
General	This section contains general information about the task.
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.

Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.
	Options:
	<ul> <li>System Default –         Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxx)</li> </ul>
	<ul> <li>Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.</li> <li>Inherited</li> <li>Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.</li> </ul>
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.
Hold Reason	Information about why the task will be put on hold when it starts.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
File Transfer Details	This section contains assorted detailed information about the task.
Transfer Protocol	Type of transfer protocol for this file transfer.  Options:
	• FTP • SFTP • UDM • FTPS
Utility Agent	Name of the Windows or Linux/Unix Agent resource that will communicate with the Universal Command Agent. If you do not specify an Agent, you must specify an agent cluster.

#### Utility Agent Variable

If enabled, the Utility Agent field converts from a reference field (where you browse and select a record) into a text field that allows you to enter a variable. Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Utility Agent reference to using a Utility Agent variable, you must change the **Utility Agent Variable** field to **Yes** and specify the Utility Agent variable in the **Utility Agent Unresolved** field. Conversely, to change from using a Utility Agent variable to using a Utility Agent reference, you must change the **Utility Agent Variable** field to **No** and specify the Utility Agent reference in the **Utility Agent** field.

#### Utility Agent Cluster

Group of Agents, one of which the Controller will choose to run this task. You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific Agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.

#### Utility Agent Cluster Variable

Indication of whether the Utility Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Utility Agent Cluster as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Utility Agent Cluster reference to using a Utility Agent Cluster variable, you must change the **Utility Agent Cluster Variable** field to **Yes** and specify the Utility Agent Cluster variable in the **Utility Agent Cluster Unresolved** field. Conversely, to change from using a Utility Agent Cluster variable to using a Utility Agent Cluster reference, you must change the **Utility Agent Cluster Variable** field to **No** and specify the Utility Agent Cluster reference in the **Utility Agent Cluster** field.

#### Utility Credentials

Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.

Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

#### Utility Credentials Variable

Indication of whether the Utility Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Utility Credentials as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Utility Credentials reference to using a Utility Credentials variable, you must change the **Utility Credentials Variable** field to **Yes** and specify the Utility Credentials variable in the **Utility Credentials Unresolved** field. Conversely, to change from using a Utility Credentials variable to using a Utility Credentials variable field to **No** and specify the Utility Credentials reference in the **Utility Credentials** field.

Transfer Type	Type of data transfer.
	Options:
	<ul><li>Binary</li><li>Text</li></ul>
Encrypt	The method of encryption that the Controller will use in the transfer.
	Options:
	<ul> <li>YES</li> <li>NO (none)</li> <li>RC4-SHA</li> <li>RC4-MD5</li> <li>AES256-SHA</li> <li>AES128-SHA</li> <li>DES-CBC3-SHA</li> <li>DES-CBC3-SHA</li> <li>NULL-SHA</li> <li>NULL-MD5</li> <li>NULL-NULL</li> <li>AES256-GCM-SHA384</li> <li>AES128-GCM-SHA256</li> </ul>
Compress	The type of data compression used in the transfer, if any.
	Options:
	• YES
	• NO
	• ZLIB • HASP
Codepage	Options:
	(See Code Pages, below.)
File Creation Option	Specifies whether the transferred file should be created (new), appended, or replace any existing file.  Options:
	• None • APPEND • NEW • REPLACE
	• NEW

Trim Trailing Spaces	If enabled, specifies that the Controller should trim trailing spaces from lines on a text transfer.
Network Fault Tolerant	Enable if the session is network fault tolerant.
Runtime Directory	Directory from which the application should be executed. Variables supported.
Form or Script	Form or Script for this UDM File Transfer to use.
Source Filename(s)	Required; Path and file name on the source UDM server.
Use Regular Expression	Enables the use of a regular expression in the Source Filename(s) field.
Destination Filename(s)	Required; Path and file name on the destination UDM server.
Source File System	Type of file system on the source server.  Options:  None DSN HFS LIB
Destination File System	Type of file system on the destination server.  Options:  None DSN HFS LIB
Source UDM Agent	Required; Name of the Agent resource defined in the Controller that describes the source UDM Agent machine (primary transfer server).
Destination UDM Agent	Required; Name of the Agent resource defined in the Controller that provides details about the destination UDM Agent machine (secondary transfer server).

Source UDM Agent Option	Defines how you will specify the Source UDM Agent.  Options:  UDM Agent - Source Agent is an UDM Agent defined in the Controller.  UDM Agent Variable - Source Agent will be defined by setting the variable in the Source UDM Agent field.  UDM Agent Hostname - Source Agent runs on the host name specified in the Source UDM Agent field.
Destination UDM Agent Option	Defines how you will specify the Destination UDM Agent.  Options:  UDM Agent - Destination Agent is an UDM Agent defined in the Controller.  UDM Agent Variable - Destination Agent will be defined by setting the variable in the Destination UDM Agent field.  UDM Agent Hostname - Destination Agent runs on the host name specified in the Destination UDM Agent field.
Script	Name of the Script to execute for this File Transfer task.  Note If you click the Details icon for a Script selected in this field, the Script Type field in the Details is read-only.
Source Credentials	Specifies the source user ID and password (local to the host on which the server is running) under which the transfer operation is being carried out.
Destination Credentials	Specifies the destination user ID and password (local to the host on which the server is running) under which the transfer operation is being carried out.
Source Credentials Variable	Indication of whether the Source Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Source Credentials as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using a Source Credentials reference to using a Source Credentials variable, you must change the Source Credentials Variable field to Yes and specify the Source Credentials variable in the Source Credentials Unresolved field. Conversely, to change from using a Source Credentials variable to using a Source Credentials reference, you must change the Source Credentials Variable field to No and specify the Source Credentials reference in the Source Credentials field.

### Destination Credentials Variable

Indication of whether the Destination Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Destination Credentials as a variable (checked). Use the format: \$(variable name). The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Destination Credentials reference to using a Destination Credentials variable, you must change the **Destination Credentials Variable** field to **Yes** and specify the Destination Credentials variable in the **Destination Credentials Unresolved** field. Conversely, to change from using a Destination Credentials variable to using a Destination Credentials variable field to **No** and specify the Destination Credentials reference in the **Destination Credentials** field.

Append	
Source	
Open	
Options	

Any additional free form open command options for the source (primary) transfer server.

### Append Destination Open Option

Any additional free form open command options for the destination (secondary) transfer server.

### Append UDM Options

Any additional free form Universal Data Mover command options.

### Exit Code Processing

Specifies how the Controller should determine whether the executed command failed or completed successfully.

#### Options:

- Success Exitcode Range
- Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field.
- Failure Exitcode Range
- Command is considered failed if its exit code falls within the range specified in the Exit Codes field.
- Success Output Contains
  - Command is considered completed successfully if its output contains the text specified in the Scan Output For field.
- Failure Output Contains
  - Command is considered failed if its output contains the text specified in the Scan Output For field.

#### Output Type-Exit Code

Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output.

#### Options:

- Standard Output (STDOUT)
- Standard Error (STDERR)
- File

Exit Codes	Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.
Scan Output For	Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this field as a regular expression.
Output File-Exit Codes	Required if Output Type = File; path and file name of the output file that should be scanned for the text in the Scan Output For field.
Retry Options	This section contains specifications for retrying the task.
Retry Exit Codes	Exit code range for which an auto-retry of tasks in FAILED status will occur. Exit code ranges must be in the same format as ranges specified in the Exit Codes field. Maximum Retries must be greater than 0.
	If this field is empty, any exit code potentially will cause a retry.
Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval (Seconds)	User-defined; number of seconds between each retry.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:
	All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.
	<ul> <li>Workflow conditional path processing; any Successors waiting on a failure path will not be released.</li> </ul>
	<ul> <li>Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which Suppress Intermediate Failures has been enabled.</li> </ul>
	Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.

Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	<ul><li>None –</li><li>Time</li></ul>
	<ul> <li>Relative Time</li> <li>Duration</li> <li>Seconds</li> </ul>
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	<ul> <li> None</li> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> <li>Same Day</li></ul>
	If today is not Monday, advance to next Monday.  Tuesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Wednesday, advance to next Wednesday.  Thursday If today is not Thursday, advance to next Thursday.  Friday If today is not Friday, advance to next Friday.  Saturday If today is not Saturday, advance to next Saturday.
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.

Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.
	Options are:
	<ul> <li>None –</li> <li>Duration</li> <li>Seconds</li> </ul>
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.
	Options are:
	• System Default
	Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is <b>yes</b> .)  • Yes
	Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  • No
	Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.
	Options:
	<ul> <li>Time - Flag the task if it starts after the specified time.</li> <li>Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.</li> </ul>

Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.
	The Late Stark Type - Time, Time and the task stark time is so heldered late. See Time, 11 hour time.
Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.
	For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.
	For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.
Late Finish Type	Required if Late Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Early Finish Type	Required if Early Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes before the specified time (see Early Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.</li> </ul>
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.		
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.		
Critical Path Options	This section contains Critical Path-related specifications for the task.		
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.		
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.		
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds Minutes Hours  Default is Minutes.		
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.		

# Execution Restriction Specification for whether or not there is a restriction for this task to be run, skipped, or held. Options are: -- None -- No restriction for this task. • Run Restriction for when this task will be run. • Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held. If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow. Restriction Period If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted. Options are: None – No period of restriction for this task. Restriction is valid if the date is before the Before Date value. Restriction is valid if the date is after the After Date value. Restriction is valid if the date is before the Before Date value and after After Date value. On Restriction is valid if the date is one of the Date List values. Before Date If Restriction Period = Before or Span; Date before which the restriction is valid. Before Time If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid. After Date If Restriction Period = After or Span; Date after which the restriction is valid. After Time If Restriction Period = After or Span; Time on the selected date after which the restriction is valid. Date List If Restriction Period = On; Date(s) on which the restriction is valid. **Statistics** This section contains time-related statistics for task instances of the task.

First Time Ran	System-supplied; date and time this task first ran.	
Last Time Ran	System-supplied; date and time the task last ran.	
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.	
Lowest Instance Time	System-supplied; shortest amount of time this task has taken to run.	
Average Instance Time	System-supplied; average amount of time this task takes to run.	
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.	
Number of Instances	System-supplied; number of instances in the database for this task.	
Metadata	This section contains Metadata information about this record.	
UUID	Universally Unique Identifier of this record.	
Updated By	Name of the user that last updated this record.	
Updated	Date and time that this record was last updated.	
Created By	Name of the user that created this record.	
Created	Date and time that this record was created.	
Status History	History of all statuses that the task instance has gone through.	
Buttons	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.	
Save	Saves a new task record in the Controller database.	
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.	
Save & View	Saves a new record in the Controller database and continues to display that record.	
New	Displays empty (except for default values) Details for creating a new task.	

Update	Saves updates to the record.			
Launch Task	Manually launches the task.			
View Parents	Displays a list of any parent Workflow tasks for this task.			
Сору	Creates a copy of this task, which you are prompted to rename.			
Delete	Deletes the current record.			
Refresh	Refreshes any dynamic data displayed in the Details.			
Close	For pop-up view only; closes the pop-up view of this task.			
Tabs	This section identif	ies the tabs across the top of the Task Details that provide access to additional information about the task.		
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.			
Actions	Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task.  Events are:  Task instance status Exit codes Late start Late finish Early finish  Actions are:			
	Email Notification	Abort the task if certain events occur. For details, see Abort Actions.  Send an email if certain events occur. For details, see Email Notification Actions.		
	Set Variable	Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow.		
	SNMP Notification	Send an email if certain events occur. For details, see SNMP Notification Actions.		
	System Operation	Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions.		

Virtual Resources	Lists all Virtual Resources to which this task is assigned.		
Mutually Exclusive	Lists all tasks that have been set to be mutually exclusive of this task.		
Instances	Lists all instances of the task.		
Triggers	List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current name="" task="">#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers.</current>		
Notes	Lists all notes associated with this record.		
Versions	Stores copies of all previous versions of the current record. See Record Versioning.		

# **Viewing a File Transfer Task Instance**

When a File Transfer task is launched, the Controller creates a task instance record of that task.

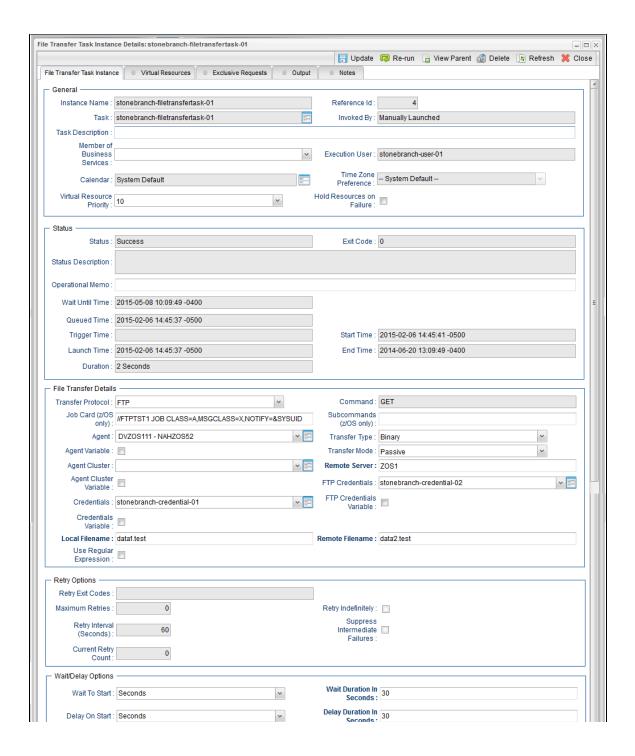

A task instance contains detailed information about a single execution of that task.

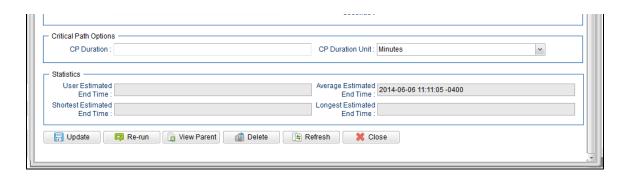

You can access a task instance from:

- Instances tab on the FTP/SFTP/FTPS or UDM File Transfer Task Details for that task
- Activity Monitor
- Task Instances list

## FTP/SFTP/FTPS File Transfer Task Instance Details

The following FTP/SFTP/FTPS File Transfer Task Instance Details contains information on the execution of the task shown in the FTP/SFTP/FTPS File Transfer Task Details.

# FTP/SFTP/FTPS File Transfer Task Instance Details Field Descriptions

The following table describes the fields, buttons, and tabs that display in FTP/SFTP/FTPS File Transfer Task Instance Details.

Field Name	Description		
General	This section contains general information about the task instance.		
Instance Name	Name of this task instance.		
Reference Id	System-supplied; the Controller increments this number each time the task is run.		
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.		
Invoked by	System-supplied; how the task instance was launched.		
	<ul> <li>Options:</li> <li>Trigger: (Trigger Name)     Instance was launched by the named trigger.</li> <li>Workflow: (Workflow Name)     Instance was launched by the named workflow.</li> <li>Manually Launched     Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.</li> </ul>		
Task Description	Description of this record. (Maximum = 200 characters.)		

Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.		
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.		
Calendar	Calendar associated with the task instance.		
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:		
	• - System Default -		
	Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.  • Server (xxx)		
	Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.  • Inherited		
	Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.		
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).		
	Default is 10.		
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.		
Status	This section contains information about the current status of the task instance.		
Status	System-supplied; see Task Instance Statuses.		
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).		
Status Description	System-supplied; additional information, if any, about the status of the task instance.		
Operational Memo	User-defined operational memo.		
	l .		

	• FTP • SFTP • UDM • FTPS
FIOLOCOI	Options:
Transfer Protocol	Type of transfer protocol for this file transfer.
File Transfer Details	This section contains assorted detailed information about the task instance.
Duration	System-supplied; amount of time the task instance took to run.
End Time	System-supplied; Date and time the task instance completed.
Start Time	System-supplied; Date and time the task instance started.
Launch Time	System-supplied; Date and time the task instance was launched.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Queued Time	System-supplied; Date and time the task was queued for processing.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Critical	Indicates that this task is in the Critical Path of a workflow.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)

Command	File Transfer command being executed.
	Options:
	<ul> <li>GET - Copies a remote file to the local computer.</li> <li>PUT - Copies a local file to the remote computer.</li> <li>MGET - Copies multiple remote files to the local computer.</li> <li>MPUT - Copies multiple local files to the remote computer.</li> <li>DELETE - Deletes the specified file from the remote computer.</li> <li>MDELETE - Deletes the specified file(s) from the remote computer</li> <li>MKDIR - Creates the specified directory on the remote computer.</li> <li>RMDIR - Removes the specified directory from the remote computer.</li> </ul>
Job Card (z/OS only)	For z/OS, the job card information for the JCL statement. Example:
	//File TransferJOB01 JOB (File Transfer,001),FANNY,MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID,CLASS=A
Subcommands (z/OS only)	For z/OS, any subcommands used in the JCL statement.
Agent	Name of the Agent resource that identifies the machine where the operation will run. If you do not specify an Agent, you must specify an Agent Cluster.
Agent Variable	Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the Agent Variable field to Yes and specify the Agent variable in the Agent Unresolved field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the Agent Variable field to No and specify the Agent reference in the Agent field.
Transfer Type	Data format of the file being transferred.
	Options:
	Binary     ASCII

Transfer Mode	If Transfer Protocol is FTP or FTPS; Transfer mode.
	Options:
	Active     Passive     Extended Passive
Agent Cluster	Group of Agents, one of which the Controller will choose to run this task (compare with Cluster Broadcast). You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.
Agent Cluster Variable	Indication of whether the Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using an Agent Cluster reference to using an Agent Cluster variable, you must change the Agent Cluster Variable field to Yes and specify the Agent Cluster variable in the Agent Cluster Unresolved field. Conversely, to change from using an Agent Cluster variable to using an Agent Cluster reference, you must change the Agent Cluster Variable field to No and specify the Agent Cluster reference in the Agent Cluster field.
Cluster Broadcast	Group of Agents, all of which will run this task (compare with Agent Cluster). You can specify a Cluster Broadcast in place of a specific Agent and/or agent cluster. Each instance of the task running on its own Agent becomes a separate task instance record in the database and displays separately on the Activity Monitor.
Remote Server	Required if Transfer Protocol = FTP, SFTP, or FTPS; name or IP address of the File Transfer server. This machine may or may not be the same as the Agent machine.  You also can specify a non-standard FTP, SFTP, or FTPS port: port number separated from the host name with a colon: "some.server.com:2222".
FTP Credentials	Login credentials that the Agent will use to access the FTP or SFTP server machine. If the File Transfer server and Agent are running on the same machine, enter the same credentials as those you entered in the Credentials field.

#### FTP Credentials Variable

Indication of whether the FTP Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the FTP Credentials as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using an FTP Credentials reference to using an FTP Credentials variable, you must change the FTP Credentials Variable field to Yes and specify the FTP Credentials variable in the FTP Credentials Unresolved field. Conversely, to change from using an FTP Credentials variable to using an FTP Credentials reference, you must change the FTP Credentials Variable field to No and specify the FTP Credentials reference in the FTP Credentials field.

#### Credentials

Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.

Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

#### Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials Variable** field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

Retry Options	This section contains specifications for retrying the task.
Move	If Transfer Protocol = FTP, SFTP, or FTPS, and Command = GET, MGET, PUT, or MPUT; Modifies the behavior of GET/MGET and PUT/MPUT by deleting the source file(s) after being transferred to the destination.  GET/MGET with Move enabled will delete the files from the remote FTP server; PUT/MPUT with Move enabled will delete the files from the local FTP client.
Remote Filename	Required if Transfer Type = FTP or SFTP; path and file name on the remote server. That is, the "transfer to" file name.
Use Regular Expression	Enables the use of a regular expression in the Local Filename field.
Local Filename	Required if Transfer Type = FTP or SFTP; path and file name on the local server. That is, the "transfer from" file name.

Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval	User-defined; number of seconds between each retry.
Current Retry Count	System-supplied; current number of times that the Controller has retried the task after it first went to failure status.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:
	All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.
	Workflow conditional path processing; any Successors waiting on a failure path will not be released.
	<ul> <li>Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which Suppress Intermediate Failures has been enabled.</li> </ul>
	Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
Next Retry Time	System-supplied for a task instance in the Failed status that is scheduled for automatic retry; Next time that a retry will be made. If a task instance is not scheduled for automatic retry, Next Retry Time does not display in the task instance Details.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.  Options are:  - None -  Time Relative Time Duration Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

## Wait Day Constraint If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day. Valid values: -- None --• If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. Same Dav Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Default is - None --. Wait Duration If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task. Wait Duration If Wait To Start = Seconds; Number of seconds to wait before starting the task. In Seconds Delay On Start Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified. Options are: None – Duration Seconds

Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Time Options	This section contains time-related statistics for the task instance.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
	Valid values:
	<ul> <li> None         Advance to the next day if the specified late start time is before the Created time of the task instance.     </li> <li>Same Day</li> </ul>
	Do not advance day.  Next Day  Advance to the next day.
	Next Business Day Advance to the next business day.
	<ul> <li>Sunday         If today is not Sunday, advance to next Sunday.     </li> <li>Monday</li> </ul>
	If today is not Monday, advance to next Monday.  Tuesday
	If today is not Tuesday, advance to next Tuesday.  • Wednesday  If today is not Wednesday, advance to next Wednesday.
	<ul> <li>Thursday</li> <li>If today is not Thursday, advance to next Thursday.</li> </ul>
	<ul> <li>Friday         If today is not Friday, advance to next Friday.     </li> <li>Saturday</li> </ul>
	If today is not Saturday, advance to next Saturday.  • Nth Day
	Advance to a specific number of days in the future.  Default is – None
Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.
	For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.
	For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.
Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.

Late Finish	Power of Mark Friends in a sold of
Type	Required if Late Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.
	Valid values:
	None     Advance to the next day if the specified late finish time is before the Created time of the task instance.
	<ul> <li>Same Day</li> <li>Do not advance day.</li> <li>Next Day</li> </ul>
	Advance to the next day.  • Next Business Day
	Advance to the next business day.  • Sunday
	If today is not Sunday, advance to next Sunday.  • Monday
	If today is not Monday, advance to next Monday.  • Tuesday
	If today is not Tuesday, advance to next Tuesday.  • Wednesday
	If today is not Wednesday, advance to next Wednesday.  • Thursday
	If today is not Thursday, advance to next Thursday.  • Friday
	If today is not Friday, advance to next Friday.  • Saturday
	If today is not Saturday, advance to next Saturday.  • Nth Day
	Advance to a specific number of days in the future.
	Default is – None
Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.

Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early Finish	
Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.
	Valid values:
	<ul> <li> None Advance to the next day if the specified early finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Thursday, advance to next Friday.</li> <li>Saturday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> </ul>
	Nth Day     Advance to a specific number of days in the future.  Default is Nane.
	Default is – None
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.

CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.
	Options:
	<ul><li>Seconds</li><li>Minutes</li><li>Hours</li></ul>
	Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.
Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.
	Options are:
	<ul> <li> None No restriction for this task.</li> <li>Run Restriction for when this task will be run.</li> <li>Skip Restriction for when this task will be skipped.</li> <li>Hold Restriction for when this task will be held.</li> </ul>
	If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.
Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.
	Options are:
	<ul> <li>None –</li> <li>No period of restriction for this task.</li> <li>Before</li> <li>Restriction is valid if the date is before the Before Date value.</li> </ul>
	<ul> <li>After     Restriction is valid if the date is after the After Date value.</li> </ul>
	<ul> <li>Span Restriction is valid if the date is before the Before Date value and after After Date value.</li> <li>On Restriction is valid if the date is one of the Date List values.</li> </ul>
	Treathead to valid it the date to one of the bate bloc valides.
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.

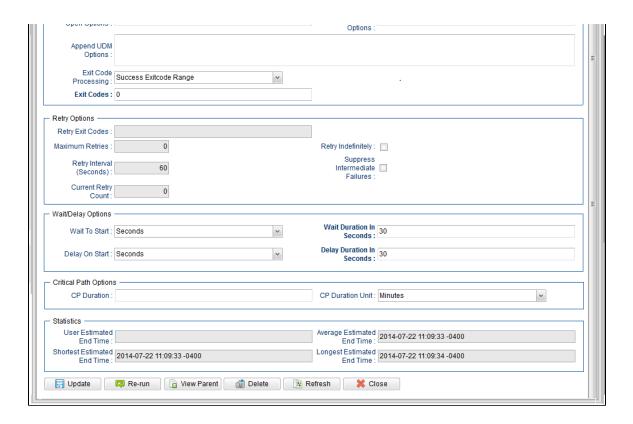

Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instance.
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.
Update	Saves updates to the record.
Force Finish	See Force Finishing a Task.
Hold	Places the task instance on Hold (see Putting a Task on Hold).
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.

Notes	Lists all notes associated with this record.		
	Note For File Transfer task instances, output always is automatically retrieved and is available from the Output tab.		
Output	Displays output generated from the process.		
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.		
Virtual Resources	Lists all Virtual Resources to which this task is assigned.		
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.		
Close	For pop-up view only; closes the pop-up view of this task instance.		
Refresh	Refreshes any dynamic data displayed in the Details.		
Delete	Deletes the current record.		
View Parent	Displays the task instance Details for the parent Workflow of this task instance.		
Re-run	See Re-running a Task.		

## **UDM File Transfer Task Instance Details**

The following UDM File Transfer Task Instance Details contains information on the execution of the task shown in the UDM File Transfer Task Details.

## **UDM File Transfer Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in UDM File Transfer Task Instance Details.

Field Name	Description
General	This section contains general information about the task instance.
Instance Name	Name of this task instance.
Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.

Invoked by	System-supplied; how the task instance was launched.
	Options:
	<ul> <li>Trigger: (Trigger Name) Instance was launched by the named trigger.</li> <li>Workflow: (Workflow Name) Instance was launched by the named workflow.</li> <li>Manually Launched Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.</li> </ul>
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.
	Options:
	<ul> <li>System Default –         Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxx)</li> </ul>
	Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.  Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.
. nonly	Options: 1 (high) - 20 (low).
	Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.

Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)
Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.
End Time	System-supplied; Date and time the task instance completed.
Duration	System-supplied; amount of time the task instance took to run.

File Transfer Details	This section contains assorted detailed information about the task instance.
Transfer Protocol	Type of transfer protocol for this file transfer.  Options:  • FTP • SFTP • UDM • FTPS
Utility Agent	Name of the Windows or Linux/Unix Agent resource that will communicate with the Universal Command Agent. If you do not specify an Agent, you must specify an agent cluster.
Utility Agent Variable	If enabled, the Utility Agent field converts from a reference field (where you browse and select a record) into a text field that allows you to enter a variable. Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using a Utility Agent reference to using a Utility Agent variable, you must change the Utility Agent Variable field to Yes and specify the Utility Agent variable in the Utility Agent Unresolved field. Conversely, to change from using a Utility Agent variable to using a Utility Agent reference, you must change the Utility Agent Variable field to No and specify the Utility Agent reference in the Utility Agent field.
Utility Agent Cluster	Group of Agents, one of which the Controller will choose to run this task. You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific Agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.
Utility Agent Cluster Variable	Indication of whether the Utility Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Utility Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using a Utility Agent Cluster reference to using a Utility Agent Cluster variable, you must change the Utility Agent Cluster Variable field to Yes and specify the Utility Agent Cluster variable in the Utility Agent Cluster Unresolved field. Conversely, to change from using a Utility Agent Cluster variable to using a Utility Agent Cluster reference, you must change the Utility Agent Cluster Variable field to No and specify the Utility Agent Cluster reference in the Utility Agent Cluster field.

#### Utility Credentials

Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.

Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

#### Utility Credentials Variable

Indication of whether the Utility Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Utility Credentials as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Utility Credentials reference to using a Utility Credentials variable, you must change the **Utility Credentials Variable** field to **Yes** and specify the Utility Credentials variable in the **Utility Credentials Unresolved** field. Conversely, to change from using a Utility Credentials variable to using a Utility Credentials variable field to **No** and specify the Utility Credentials reference in the **Utility Credentials** field.

#### Transfer Type

Type of data transfer.

Options:

- Binary
- Text

#### Encrypt

The method of encryption that the Controller will use in the transfer.

Options:

- YES
- NO (none)
- RC4-SHA
- RC4-MD5
- AES256-SHA
- AES128-SHA
- DES-CBC3-SHA
- DES-CBC-SHA
- DE3-CBC-311/
- NULL-SHA
- NULL-MD5
- NULL-NULL
- AES256-GCM-SHA384
- AES128-GCM-SHA256

Compress	
	The type of data compression used in the transfer, if any.
	Options:
	• YES
	• NO • ZLIB
	• HASP
Codepage	Options: (see Code Pages, below)
File	
Creation Option	Specifies whether the transferred file should be created (new), appended, or replace any existing file.
	Options:
	• None
	APPEND     NEW
	• REPLACE
Trim Trailing	
Spaces	If enabled, specifies that the Controller should trim trailing spaces from lines on a text transfer.
Network	
Fault	Enable if the session is network fault tolerant.
Tolerant	
Runtime Directory	Directory from which the application should be executed. Variables supported.
Directory	Ellostery from miles the application should be executed. Valiables cappelled.
Source	
Filename(s)	Required; Path and file name on the source UDM server.
Use Regular	Enables the use of a regular expression in the Source Filename(s) field.
Expression	
Destination Filename	Required; Path and file name on the destination UDM server.
riiciidiile	noquirou, i aut and me name on the destination obiti server.

Source File System	Type of file system on the source server.
	Options:
	• None
	• DSN • HFS
	• LIB
Destination File System	Type of file system on the destination server.
	Options:
	• None
	• DSN • HFS
	• LIB
Source	
UDM Agent	Required; Name of the Agent resource defined in the Controller that describes the source UDM Agent machine (primary transfer server).
Destination	
UDM Agent	Required; Name of the Agent resource defined in the Controller that provides details about the destination UDM Agent machine (secondary transfer server).
Source UDM Agent	Defines how you will specify the Source UDM Agent.
Option	Options:
	<ul> <li>UDM Agent - Source Agent is an UDM Agent defined in the Controller.</li> <li>UDM Agent Variable - Source Agent will be defined by setting the variable in the Source UDM Agent field.</li> </ul>
	UDM Agent Hostname - Source Agent runs on the host name specified in the Source UDM Agent field.
Destination	Defines how you will are eife the Destination UDM A rest
UDM Agent Option	Defines how you will specify the Destination UDM Agent.
	Options:
	<ul> <li>UDM Agent - Destination Agent is an UDM Agent defined in the Controller.</li> <li>UDM Agent Variable - Destination Agent will be defined by setting the variable in the Destination UDM Agent field.</li> </ul>
	<ul> <li>UDM Agent Hostname - Destination Agent runs on the host name specified in the Destination UDM Agent field.</li> </ul>
Source	
Credentials	Specifies the source user ID and password (local to the host on which the server is running) under which the transfer operation is being carried out.

Destination Credentials	Specifies the destination user ID and password (local to the host on which the server is running) under which the transfer operation is being carried out.			
Source Credentials Variable	Indication of whether the Source Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Source Credentials as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.			
	Note When updating multiple Tasks, to change from using a Source Credentials reference to using a Source Credentials variable, you must change the Source Credentials Variable field to Yes and specify the Source Credentials variable in the Source Credentials Unresolved field. Conversely, to change from using a Source Credentials variable to using a Source Credentials reference, you must change the Source Credentials Variable field to No and specify the Source Credentials reference in the Source Credentials field.			
Destination Credentials Variable	Indication of whether the Destination Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Destination Credentials as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.			
	Note When updating multiple Tasks, to change from using a Destination Credentials reference to using a Destination Credentials variable, you must change the Destination Credentials Variable field to Yes and specify the Destination Credentials variable in the Destination Credentials Unresolved field. Conversely, to change from using a Destination Credentials variable to using a Destination Credentials reference, you must change the Destination Credentials Variable field to No and specify the Destination Credentials reference in the Destination Credentials field.			
Append Source Open Options	Any additional free form open command options for the source (primary) transfer server.			
Append Destination Open Option	Any additional free form open command options for the destination (secondary) transfer server.			
Append UDM Options	Any additional free form Universal Data Mover command options.			

Specifies how the Controller should determine whether the executed command failed or completed successfully.
Options:
<ul> <li>Success Exitcode Range</li> <li>Command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field.</li> </ul>
Failure Exitcode Range
Command is considered failed if its exit code falls within the range specified in the Exit Codes field.  • Success Output Contains
Command is considered completed successfully if its output contains the text specified in the Scan Output For field.  • Failure Output Contains
Command is considered failed if its output contains the text specified in the Scan Output For field.
Required if Exit Code Processing = Success Output Contains or Failure Output Contains; type of output.
Options:
<ul> <li>Standard Output (STDOUT)</li> <li>Standard Error (STDERR)</li> </ul>
• File
Required if Exit Code Processing = Success Exitcode Range or Failure Exitcode Range; range of exit codes. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.
Required if Exit Code Processing = Success Output Contains or Failure Output Contains; text for which the Controller should scan the output file. The Controller will process this
field as a regular expression.
Required if Output Type = File; path and file name of the output file that should be scanned for the text in the Scan Output For field.
required if output Type = Tile, path and the flame of the output like that should be scanned for the text in the ocan output To fleid.
This section contains specifications for retrying the task.
Exit code range for which an auto-retry of tasks in FAILED status will occur. Exit code ranges must be in the same format as ranges specified in the Exit Codes field. Maximum Retries must be greater than 0.
If this field is empty, any exit code potentially will cause a retry.
User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.

Retry Interval	User-defined; number of seconds between each retry.
Current Retry Count	System-supplied; current number of times that the Controller has retried the task after it first went to failure status.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:
	<ul> <li>All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.</li> </ul>
	Workflow conditional path processing; any Successors waiting on a failure path will not be released.
	• Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which <b>Suppress Intermediate Failures</b> has been enabled.
	Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
Next Retry Time	System-supplied for a task instance in the Failed status that is scheduled for automatic retry; Next time that a retry will be made. If a task instance is not scheduled for automatic retry, Next Retry Time does not display in the task instance Details.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:      - None -     Time     Relative Time     Duration     Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

#### Wait Day Constraint If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day. Valid values: -- None --• If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. Same Day Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday, Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Default is - None --. Wait If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task. Duration Wait Duration In If Wait To Start = Seconds; Number of seconds to wait before starting the task. Seconds Delay On Start Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified. Options are: None – Duration Seconds

Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Time Options	This section contains time-related specifications for the task instance.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.

### Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Dav Advance to a specific number of days in the future. Default is - None --. Late Start Nth Amount If Late Start Day Constraint = Nth Day; Number of days to advance. Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.		
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.		
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.		
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  - None - Advance to the next day if the specified late finish time is before the Created time of the task instance Same Day Do not advance day Next Day Advance to the next day Next Business Day Advance to the next business day Sunday If today is not Sunday, advance to next Sunday Monday If today is not Monday, advance to next Monday Tuesday If today is not Tuesday, advance to next Wednesday Wednesday If today is not Tuesday, advance to next Wednesday Thursday If today is not Thursday, advance to next Thursday Friday If today is not Friday, advance to next Friday Saturday If today is not Friday, advance to next Saturday Nit Day Advance to a specific number of days in the future.  Default is - None		
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.		

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.			
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.			
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.			
Early Finish Type	Required if Early Finish is enabled.  Options:			
	<ul> <li>Time - Flag the task if it finishes before the specified time (see Early Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.</li> </ul>			
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.			

Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  • None Advance to the next day if the specified early finish time is before the Created time of the task instance.  • Same Day Do not advance day.  • Next Day Advance to the next day.  • Next Business Day Advance to the next business day.  • Sunday If today is not Sunday, advance to next Sunday.  • Monday If today is not Monday, advance to next Monday.  • Tuesday If today is not Tuesday, advance to next Tuesday.  • Wednesday If today is not Thursday, advance to next Wednesday.  • Thursday If today is not Thursday, advance to next Thursday.  • Friday If today is not Friday, advance to next Friday.  • Saturday If today is not Friday, advance to next Friday.  • Saturday If today is not Friday, advance to next Friday.  • Next Day If today is not Saturday, advance to next Saturday.  • Nth Day			
	Default is – None			
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.			
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.			
Critical Path Options	This section contains Critical Path-related specifications for the task.			
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.			

# CP Duration (Resolved)

Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.

#### CP Duration Unit

Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select **Minutes** in this field.

#### Options:

- Seconds
- Minutes
- Hours

#### Default is Minutes.

# Workflow Execution Options

This section contains Execution Restriction specifications for the task if it is within a Workflow.

## Execution Restriction

Specification for whether or not there is a restriction for this task to be run, skipped, or held.

#### Options are:

- -- None -- No restriction for this task.
- Run Restriction for when this task will be run.
- Skip Restriction for when this task will be skipped.
- Hold Restriction for when this task will be held.

If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

#### Restriction Period

If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.

#### Options are:

- None
  - No period of restriction for this task.
- Before
  - Restriction is valid if the date is before the Before Date value.
- After
  - Restriction is valid if the date is after the After Date value.
- Span
- Restriction is valid if the date is before the Before Date value and after After Date value.
- On

Restriction is valid if the date is one of the Date List values.

Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.			
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.			
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.			
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.			
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.			
Statistics	This section contains time-related statistics for the task instances of this task.			
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.			
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.			
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.			
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.			
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.			
Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.			
Update	Saves updates to the record.			
Force Finish	See Force Finishing a Task.			
Hold	Places the task instance on Hold (see Putting a Task on Hold).			

Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.			
Re-run	See Re-running a Task.			
View Parent	Displays the task instance Details for the parent Workflow of this task instance.			
Delete	Deletes the current record.			
Refresh	Refreshes any dynamic data displayed in the Details.			
Close	For pop-up view only; closes the pop-up view of this task instance.			
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.			
Virtual Resources	Lists all Virtual Resources to which this task is assigned.			
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.			
Output	Displays output generated from the process.			
	Note For File Transfer task instances, output always is automatically retrieved and is available from the Output tab.			
Notes	Lists all notes associated with this record.			

## **Output Redirection**

An Agent processes File Transfer (UDM), Universal Command, and SAP tasks differently than Windows and Linux/Unix tasks. File Transfer (UDM), Universal Command, and SAP command lines are sent to the user process via standard input, so any redirection operators entered as task command input are not processed as expected.

If you want to direct output from a File Transfer (UDM) task to your file system, the **-uagstdio** command option lets you specify the same output redirection commands that are available for Windows and Linux/Unix tasks. UAG will apply the user-specified value for **-uagstdio** directly to the command image.

The I/O redirection commands that you can use with **-uagstdio** are dependent on the OS/command shell. You should be able to set up any redirection that the OS/command shell supports (just as with Windows and Linux/Unix tasks).

The syntax of -uagstdio is similar to Universal Data Mover, Universal Command, and Universal Connector command line options; option followed by value.

For a File Transfer (UDM ) task, you can specify uagstdio in the following field:

· Append UDM Options

## -uagstdio Examples

```
-uagstdio >C:\UDMOUT\udm.out
```

If the -uagstdio value contains spaces, it must be enclose in double quotation marks ( "):

```
-uagstdio ">C:\UDMOUT\udm.out 2>C:\UDMOUT\udm.err"
```

If the quoted value itself requires double quotation marks, they must be doubled (""):

```
-uagstdio ">C:\tmp\""udm output""\udm.out 2>C:\tmp\""udm output""\udm.err"
```

## Specifying When a Task Runs

You can run the task as part of a workflow, specify triggers that run the task automatically based on times or events, or run the task manually.

## **Running a File Transfer Task**

You can run a File Transfer task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the File Transfer tasks list or File Transfer Task Details Action menu.
- As part of a workflow.
- Specify triggers that run the task automatically based on times or events.

## **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

## **Code Pages**

The following table identifies all supported code pages for a UDM File Transfer task.

ISO8859-1	op437	IBM Portugal 037
ISO8859-2	op737	IBM German 273
ISO8859-3	op775	IBM Danish and Norwegian 277
ISO8859-4	op850	IBM Sweden and Finland 278
ISO8859-5	op852	IBM Italian 280
ISO8859-6	op855	IBM Spanish 284
ISO8859-7	op857	IBM International 500
ISO8859-8	op860	IBM Greek 875
ISO8859-9	op861	IBM Latin-1 1047
ISO8859-10	cp862	IBM Portugal 1140
ISO8859-13	cp863	IBM German 1141
ISO8859-14	cp864	IBM Danish 1142
ISO8859-15	cp865	IBM Finish 1143
	cp866	IBM Italian 1144
	cp869	IBM Spanish 1145
	cp874	IBM UK 1146
	cp1250	IBM Swiss 1148
	cp1251	IBM Greek 4971
	cp1252	
	cp1253

# **Manual Task**

- Overview
- Built-In Variables
- Creating a Manual Task
  - Manual Task Details
  - Manual Task Field Descriptions
- Viewing a Manual Task Instance
   Manual Task Instance Details

  - Manual Task Instance Details Field Descriptions
- Running a Manual TaskMonitoring Task Execution

### **Overview**

Manual tasks are used to create a pause in a Workflow during which the user must take some action.

The processing of a Manual task within a Workflow is described here:

Step 1	While its upstream tasks are running, a Manual task instance remains in WAITING status. When the Manual task instance launches, it goes immediately into ACTION REQUIRED status, meaning you must perform some manual activity. Universal Controller also sets the <b>Started Time</b> in the Manual task instance to the time that the task instance went into the ACTION REQUIRED status.
Step 2	Optionally, you can re-set the <b>Started Time</b> of the Manual task by issuing the <b>Set Started</b> command. Either:  1. On the Activity Monitor, right-click the Manual task and select <b>Set Started</b> .  2. On the Workflow Monitor, right-click the Manual task and select <b>Commands &gt; Set Started</b> .
Step 3	When you have completed the activities called for in the Manual task, you must indicate that the task is completed and that the Workflow can continue. Either:  1. On the Activity Monitor, right-click the Manual task and select <b>Set Completed</b> .  2. On the Workflow Monitor, right-click the Manual task and select <b>Commands &gt; Set Completed</b> .
Step 4	The Manual task goes into SUCCESS status, the End Time is set, and the Workflow continues.  If the Manual task is not completed but you still want the Workflow to continue, select <b>Force Finish</b> .

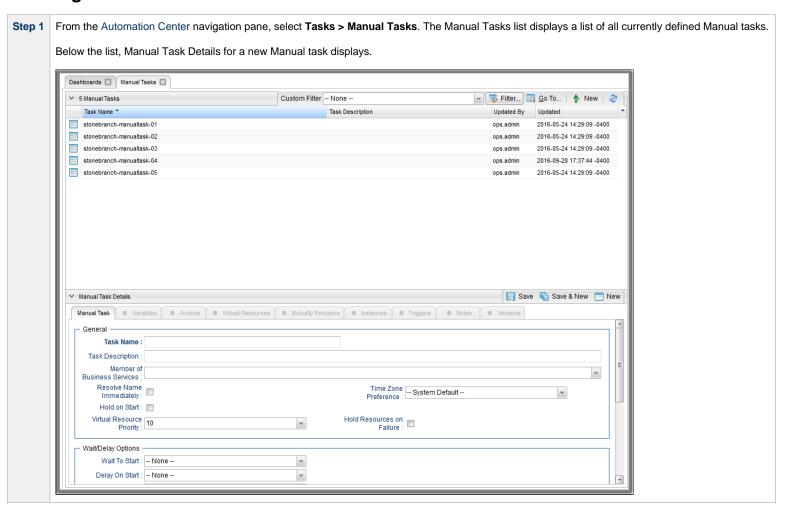

You also can set a Manual task to STARTED or COMPLETED status from the Command Line Interface (CLI).

### **Built-In Variables**

The following built-in variables can be used in a Manual task to pass data where appropriate:

Task Instance variables

# **Creating a Manual Task**

Step 2 Enter/select Details for a new Manual task, using the field descriptions below as a guide.

- Required fields display in **boldface**.
- Default values for fields, if available, display automatically.

To display more of the Details fields on the screen, you can either:

- Use the scroll bar.
- Temporarily hide the list above the Details.
- Click the **New** button above the list to display a pop-up version of the Details.

Step 3 Click a Save button. The task is added to the database, and all buttons and tabs in the Task Details are enabled.

#### Note

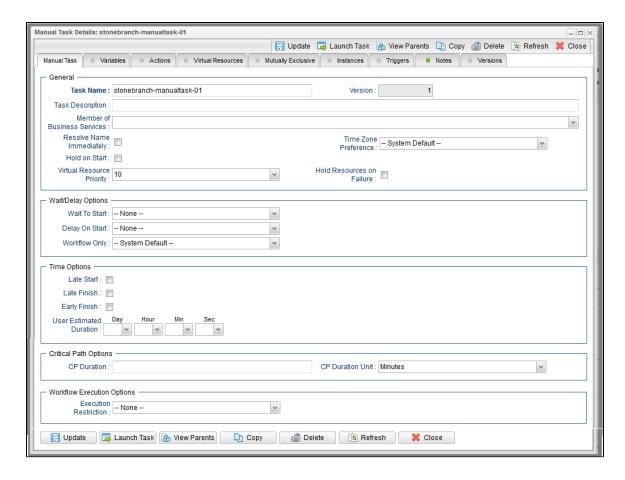

To open an existing record on the list, either:

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click Open In Tab in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

### **Manual Task Details**

The following Manual Task Details is for an existing Manual task.

Depending on the values that you enter / select for these fields, and whether or not the Manual task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the Manual Task Details.

## **Manual Task Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the Manual Task Details.

Field Name	Description
General	This section contains general information about the task.
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.

Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.
Hold Reason	Information about why the task will be put on hold when it starts.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.

Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	<ul> <li>None –</li> <li>Time</li> <li>Relative Time</li> </ul>
	<ul><li>Duration</li><li>Seconds</li></ul>
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	• None
	<ul> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> </ul>
	<ul> <li>Same Day</li> <li>Do not advance day.</li> <li>Next Day</li> </ul>
	Advance to the next day.  Next Business Day
	Advance to the next business day.  Sunday If today is not Sunday, advance to next Sunday.
	<ul> <li>Monday         If today is not Monday, advance to next Monday.     </li> </ul>
	<ul> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday</li> </ul>
	If today is not Wednesday, advance to next Wednesday.  • Thursday
	If today is not Thursday, advance to next Thursday.  ● Friday
	If today is not Friday, advance to next Friday.  Saturday If today is not Saturday, advance to next Saturday.
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.

Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.
	Options are:
	<ul> <li>None –</li> <li>Duration</li> <li>Seconds</li> </ul>
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.
	Options are:
	<ul> <li> System Default         Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.)</li> <li>Yes</li> </ul>
	Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  No
	Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.
	Options:
	<ul> <li>Time - Flag the task if it starts after the specified time.</li> <li>Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.</li> </ul>

Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.
Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.  Valid values:
	- None Advance to the next day if the specified late start time is before the Created time of the task instance Same Day Do not advance day Next Day Advance to the next day Next Business Day Advance to the next business day Sunday If today is not Sunday, advance to next Sunday Monday If today is not Monday, advance to next Monday Tuesday If today is not Tuesday, advance to next Tuesday Wednesday If today is not Wednesday, advance to next Wednesday Thursday If today is not Thursday, advance to next Thursday Friday If today is not Thursday, advance to next Thursday Friday If today is not Thursday, advance to next Friday Saturday If today is not Saturday, advance to next Friday Saturday If today is not Saturday, advance to next Saturday Nth Day Advance to a specific number of days in the future.
	Default is - None
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.  For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.
	For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.

Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.
Late Finish Type	Required if Late Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:
	- None Advance to the next day if the specified late finish time is before the Created time of the task instance.  Same Day Do not advance day.  Next Day Advance to the next day.  Next Business Day Advance to the next business day.  Sunday If today is not Sunday, advance to next Sunday.  Monday If today is not Monday, advance to next Monday.  Tuesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Wednesday, advance to next Wednesday.  Thursday If today is not Thursday, advance to next Thursday.  Thursday If today is not Thursday, advance to next Thursday.  Friday If today is not Friday, advance to next Friday.  Saturday If today is not Saturday, advance to next Saturday.  Nth Day Advance to a specific number of days in the future.  Default is - None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  • None Advance to the next day if the specified early finish time is before the Created time of the task instance. • Same Day Do not advance day. • Next Day Advance to the next day. • Next Business Day Advance to the next business day. • Sunday If today is not Sunday, advance to next Sunday. • Monday If today is not Monday, advance to next Monday. • Tuesday If today is not Tuesday, advance to next Wednesday. • Wednesday If today is not Tursday, advance to next Wednesday. • Thursday If today is not Tursday, advance to next Thursday. • Friday If today is not Friday, advance to next Friday. • Saturday If today is not Saturday, advance to next Saturday. • Nt Day Advance to a specific number of days in the future.  Default is None

Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.
	Seconds     Minutes     Hours  Default is Minutes.
	Options:  • Seconds
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
Critical Path Options	This section contains Critical Path-related specifications for the task.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.

## Execution Restriction Specification for whether or not there is a restriction for this task to be run, skipped, or held. Options are: -- None -- No restriction for this task. • Run Restriction for when this task will be run. • Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held. If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow. Restriction Period If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted. Options are: • - None -No period of restriction for this task. Restriction is valid if the date is before the Before Date value. Restriction is valid if the date is after the After Date value. Restriction is valid if the date is before the Before Date value and after After Date value. On Restriction is valid if the date is one of the Date List values. Before Date If Restriction Period = Before or Span; Date before which the restriction is valid. Before If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid. Time After Date If Restriction Period = After or Span; Date after which the restriction is valid. After Time If Restriction Period = After or Span; Time on the selected date after which the restriction is valid. Date List If Restriction Period = On; Date(s) on which the restriction is valid. **Statistics** This section contains time-related statistics for task instances of the task.

First Time Ran	System-supplied; date and time this task first ran.
Last Time Ran	System-supplied; date and time the task last ran.
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.
Lowest Instance Time	System-supplied; shortest amount of time this task has taken to run.
Average Instance Time	System-supplied; average amount of time this task takes to run.
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.
Number of Instances	System-supplied; number of instances in the database for this task.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Buttons	This section identifies the buttons displayed above and below the Details that let you perform various actions.
Save	Saves a new task record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new task.
Update	Saves updates to the record.

Launch Task	Manually launches the task.
View Parents	Displays a list of any parent Workflow tasks for this task.
Сору	Creates a copy of this task, which you are prompted to rename.
Delete	Deletes the current record.  Note You cannot delete a task if it is either:  Specified in an enabled Trigger. The only task specified in a disabled Trigger.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task.
Tabs	This section identifies the tabs across the top of the Details that provide access to additional information about the task.
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.

### Actions Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task. Events are: Task instance status Exit codes Late start Late finish Early finish Actions are: Abort the task if certain events occur. For details, see Abort Actions. **Abort Action** Send an email if certain events occur. For details, see Email Notification Actions. **Email** Notification **Set Variable** Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow. **SNMP** Send an email if certain events occur. For details, see SNMP Notification Actions. **Notification** Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions. System Operation Virtual Lists all Virtual Resources to which this task is assigned. Resources Mutually Lists all tasks that have been set to be mutually exclusive of this task. **Exclusive** Lists all instances of the task. Instances **Triggers** List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current task name>#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers. Notes Lists all notes associated with this record. Versions Stores copies of all previous versions of the current record. See Record Versioning.

# **Viewing a Manual Task Instance**

When a Manual task is launched, the Controller creates a task instance record of that task.

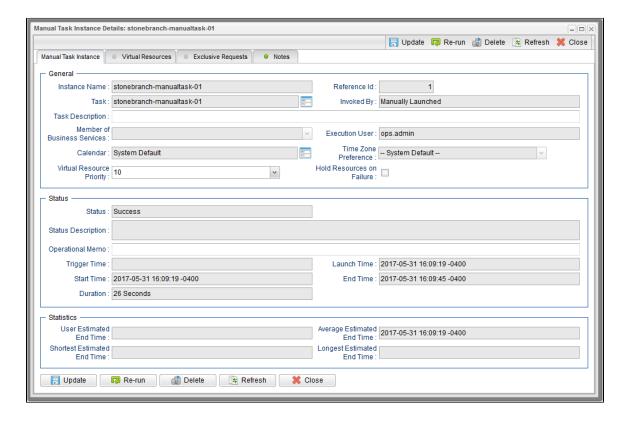

A task instance contains detailed information about a single execution of that task.

You can access a task instance from:

- Instances tab on the Manual Task Details for that task
- Activity Monitor
- Task Instances list

### **Manual Task Instance Details**

The following Manual Task Instance Details contains information on the execution of the task shown in the Manual Task Details.

# **Manual Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in Manual Task Instance Details.

Field Name	Description
General	This section contains general information about the task instance.
Instance Name	Name of this task instance.
Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.
Invoked by	System-supplied; how the task instance was launched.  Options:  Trigger: (Trigger Name) Instance was launched by the named trigger.  Workflow: (Workflow Name) Instance was launched by the named workflow.  Manually Launched Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.

Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:
	<ul> <li>System Default –         Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxx)         Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.</li> <li>Inherited</li> </ul>
	Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).
	Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)
Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Queued Time	System-supplied; Date and time the task was queued for processing.

Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.
End Time	System-supplied; Date and time the task instance completed.
Duration	System-supplied; amount of time the task instance took to run.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.  Options are:  - None -  Time Relative Time Duration Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

### Wait Day Constraint If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day. Valid values: -- None --• If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. Same Day Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Default is - None --. Wait If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task. Duration Wait **Duration In** If Wait To Start = Seconds; Number of seconds to wait before starting the task. Seconds Delay On Start Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified. Options are: None – Duration Seconds

Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Time Options	This section contains time-related specifications for the task instance.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.

### Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday, Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future. Default is - None --. Late Start Nth If Late Start Day Constraint = Nth Day; Number of days to advance. Amount Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  • None     Advance to the next day if the specified early finish time is before the Created time of the task instance.  • Same Day     Do not advance day.  • Next Day     Advance to the next day.  • Next Business Day     Advance to the next business day.  • Sunday     If today is not Sunday, advance to next Sunday.  • Monday     If today is not Monday, advance to next Monday.  • Tuesday     If today is not Tuesday, advance to next Tuesday.  • Wednesday     If today is not Wednesday, advance to next Wednesday.  • Thursday     If today is not Thursday, advance to next Thursday.  • Friday     If today is not Friday, advance to next Friday.  • Saturday     If today is not Saturday, advance to next Saturday.  • If today is not Saturday, advance to next Saturday.  • Nith Day     Advance to a specific number of days in the future.  Default is - None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.

### CP Duration (Resolved)

Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.

#### CP Duration Unit

Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select **Minutes** in this field

#### Options:

- Seconds
- Minutes
- Hours

#### Default is Minutes.

# Workflow Execution Options

This section contains Execution Restriction specifications for the task if it is within a Workflow.

# Execution Restriction

Specification for whether or not there is a restriction for this task to be run, skipped, or held.

#### Options are:

- · -- None -- No restriction for this task.
- Run Restriction for when this task will be run.
- Skip Restriction for when this task will be skipped.
- Hold Restriction for when this task will be held.

If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

#### Restriction Period

If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.

#### Options are:

- - None -
  - No period of restriction for this task.
- Before
  - Restriction is valid if the date is before the Before Date value.
- After
  - Restriction is valid if the date is after the After Date value.
- Span
- Restriction is valid if the date is before the Before Date value and after After Date value.
- On

Restriction is valid if the date is one of the Date List values.

Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instance.
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Status History	History of all statuses that the task instance has gone through.

Update   Saves updates to the record.	Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.
Finish See Force Finishing a Task.  Hold Places the task instance on Hold (see Putting a Task on Hold).  Set Started Set Completed  Set the task instance to the Started status.  Sets the task instance to the Success status.  Completed  Skip For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.  Re-run See Re-running a Task.  View Parent Displays the task instance Details for the parent Workflow of this task instance.  Retrieve Output See Retrieving Output.  Delete Deletes the current record.  Refresh Refreshes any dynamic data displayed in the Details.  Close For pop-up view only; closes the pop-up view of this task instance.  This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.  Virtual	Update	Saves updates to the record.
Places the task instance on Hold (see Putting a Task on Hold).  Set Sets the task instance to the Started status.  Set Sets the task instance to the Success status.  Skip For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.  Re-run See Re-running a Task.  View Parent Displays the task instance Details for the parent Workflow of this task instance.  Retrieve Output See Retrieving Output.  Delete Deletes the current record.  Refresh Refreshes any dynamic data displayed in the Details.  Close For pop-up view only; closes the pop-up view of this task instance.  Tabs This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.		See Force Finishing a Task.
Set Sets the task instance to the Success status.  Set Ship For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.  Re-run See Re-running a Task.  View Parent Displays the task instance Details for the parent Workflow of this task instance.  Retrieve Output See Retrieving Output.  Delete Deletes the current record.  Refresh Refreshes any dynamic data displayed in the Details.  Close For pop-up view only; closes the pop-up view of this task instance.  Tabs This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.	Hold	Places the task instance on Hold (see Putting a Task on Hold).
Completed  Skip For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.  Re-run See Re-running a Task.  View Parent Displays the task instance Details for the parent Workflow of this task instance.  Retrieve Output See Retrieving Output.  Delete Deletes the current record.  Refresh Refreshes any dynamic data displayed in the Details.  Close For pop-up view only; closes the pop-up view of this task instance.  Tabs This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.		Sets the task instance to the Started status.
For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.  Re-run  See Re-running a Task.  View Parent  Displays the task instance Details for the parent Workflow of this task instance.  Retrieve Output  See Retrieving Output.  Delete  Deletes the current record.  Refresh Refreshes any dynamic data displayed in the Details.  Close For pop-up view only; closes the pop-up view of this task instance.  Tabs  This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.  Virtual		Sets the task instance to the Success status.
View Parent Displays the task instance Details for the parent Workflow of this task instance.  Retrieve Output Delete Deletes the current record.  Refresh Refreshes any dynamic data displayed in the Details.  Close For pop-up view only; closes the pop-up view of this task instance.  Tabs This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.  Virtual	Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.
Parent Displays the task instance Details for the parent Workflow of this task instance.  Retrieve Output See Retrieving Output.  Delete Deletes the current record.  Refresh Refreshes any dynamic data displayed in the Details.  Close For pop-up view only; closes the pop-up view of this task instance.  Tabs This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.  Virtual	Re-run	See Re-running a Task.
Output       See Retrieving Output.         Delete       Deletes the current record.         Refresh       Refreshes any dynamic data displayed in the Details.         Close       For pop-up view only; closes the pop-up view of this task instance.         Tabs       This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.         Virtual		Displays the task instance Details for the parent Workflow of this task instance.
Refresh Refreshes any dynamic data displayed in the Details.  Close For pop-up view only; closes the pop-up view of this task instance.  Tabs This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.  Virtual		See Retrieving Output.
Close For pop-up view only; closes the pop-up view of this task instance.  Tabs This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.  Virtual	Delete	Deletes the current record.
Tabs  This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.  Virtual	Refresh	Refreshes any dynamic data displayed in the Details.
Virtual	Close	For pop-up view only; closes the pop-up view of this task instance.
Virtual  Pageurage Lists all Virtual Resources to which this task is assigned	Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.
resources Lists all virtual resources to which this task is assigned.	Virtual Resources	Lists all Virtual Resources to which this task is assigned.
Exclusive Requests Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.		Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.
Notes  Lists all notes associated with this record.	Notes	Lists all notes associated with this record.

# **Running a Manual Task**

You can run a Manual task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the Manual Tasks list or Manual Task Details Action menu.
- As part of a workflow.
- Specify triggers that run the task automatically based on times or events.

# **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

# **Timer Task**

- Overview
- Built-In Variables
- Creating a Timer Task
  - Timer Task Details
  - Timer Task Details Field Descriptions
- Viewing a Timer Task Instance
  - Timer Task Instance Details
  - Timer Task Instance Details Field Descriptions
- Running a Timer Task
- Monitoring Task Execution

### **Overview**

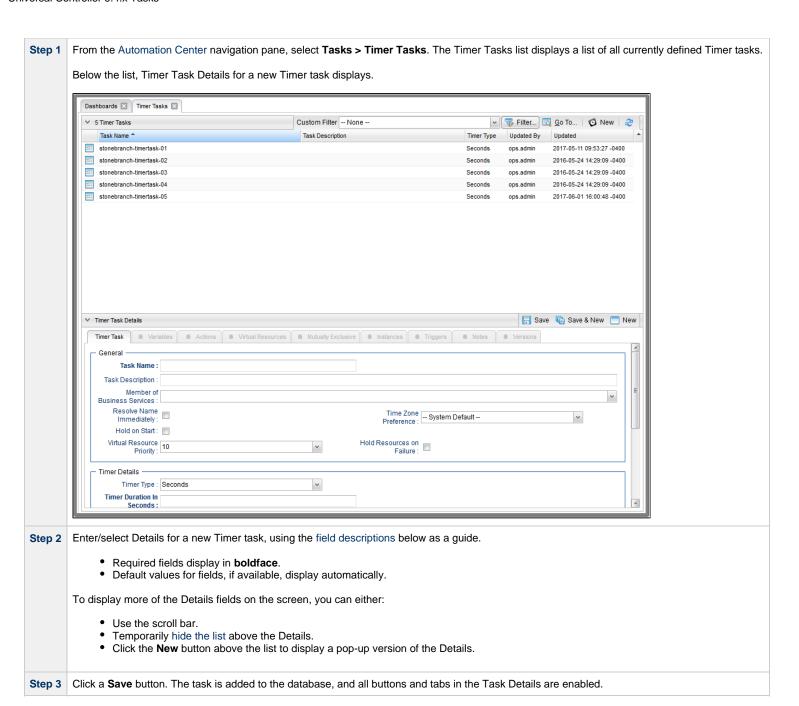

The Timer task allows you to execute a timer command for a specified period of time or until a specific time. This task is helpful, for example, if you need to impose a pause in the processing of a Workflow.

### **Built-In Variables**

The following built-in variables can be used in a Manual task to pass data where appropriate:

Task Instance variables

# **Creating a Timer Task**

#### Note

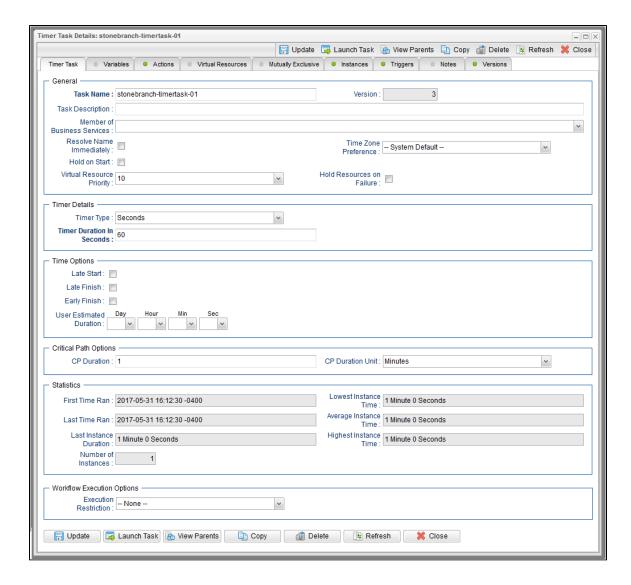

To open an existing record on the list, either:

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click **Open In Tab** in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

### **Timer Task Details**

The following Linux/Unix Task Details is for an existing Linux/Unix task.

Depending on the values that you enter / select for these fields, and whether or not the Timer task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the Timer Task Details.

# **Timer Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the Timer Task Details.

Field Name	Description
General	This section contains general information about the task.

Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:
	<ul> <li>System Default –         Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxx)         Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.</li> <li>Inherited         Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.</li> </ul>
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.
Hold Reason	Information about why the task will be put on hold when it starts.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.

Timer Details	This section contains assorted detailed information about the task.
Timer Type	User-supplied; the type of Timer command you want to execute.
	Options:
	<ul> <li>Time         Use the Timer Time field (and, optionally, the Timer Day Constraint field) to specify the time of day that you want the Timer task to be completed.     </li> <li>Relative Time         Use the Timer Time field (and, optionally, the Timer Day Constraint field) to specify time of day, relative to the Trigger/Launch Time, that you want the Timer task to be     </li> </ul>
	completed.  • Duration
	Use the Timer Duration field to specify the number of days, hours, minutes, and/or seconds that the Timer task will run.  • Seconds Use the Timer Duration in Seconds field to specify the number of seconds that the Timer task will run.
Timer Time (HH:MM)	If Timer Type = Time; Time of day (in 24-hour time) that the Timer task should go to a completed status.
Timer Day Constraint	If Timer Type = Time or Relative Time; Specification for whether or not to advance the timer to another day.
	Valid values:
	<ul> <li> None</li> <li>If Timer Type = Time; Advance to the next day if calculated wait time is before the current time.</li> <li>If Timer Type = Relative Time; Advance to the next day if calculated wait time is before the Trigger/Launch Time.</li> <li>Same Day</li> </ul>
	Do not advance day.  Next Day Advance to the next day.
	Next Business Day     Advance to the next business day.
	<ul> <li>Sunday         If today is not Sunday, advance to next Sunday.     </li> <li>Monday</li> </ul>
	If today is not Monday, advance to next Monday.  • Tuesday If today is not Tuesday, advance to next Tuesday.
	<ul> <li>Wednesday         If today is not Wednesday, advance to next Wednesday.     </li> <li>Thursday</li> </ul>
	If today is not Thursday, advance to next Thursday.  • Friday
	If today is not Friday, advance to next Friday.  • Saturday If today is not Saturday, advance to next Saturday.
	Default is – None

Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.
	<ul> <li>Options:</li> <li>Time - Flag the task if it starts after the specified time.</li> <li>Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.</li> </ul>
Late Start Type	Required if Late Start is enabled.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Time Options	This section contains time-related specifications for the task.
Timer Duration in Seconds	If Timer Type = Seconds; Number of seconds the Timer task will run.
Timer Duration	If Timer Type = Duration; Number of days, hours, minutes, and/or seconds the Timer task will run.

### Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Same Dav Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future. Default is - None --. Late Start Nth Amount If Late Start Day Constraint = Nth Day; Number of days to advance. Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Late Finish Type	Required if Late Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:
	<ul> <li> None Advance to the next day if the specified late finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Tuesday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Wednesday.</li> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul> Default is - None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.
Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.

Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  • None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.

Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds Minutes Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.
Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.  Options are:  - None No restriction for this task. Run Restriction for when this task will be run. Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held.  If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.
	<ul> <li>Options are:</li> <li>None – No period of restriction for this task.</li> <li>Before Restriction is valid if the date is before the Before Date value.</li> <li>After Restriction is valid if the date is after the After Date value.</li> <li>Span Restriction is valid if the date is before the Before Date value and after After Date value.</li> <li>On Restriction is valid if the date is one of the Date List values.</li> </ul>
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Workflow Execution Options	This section contains Critical Path-related specifications for the task.
Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.  Options are:  - None No restriction for this task. Run Restriction for when this task will be run. Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held.  If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.
	Options are:
	• - None -
	No period of restriction for this task.
	<ul> <li>Before         Restriction is valid if the date is before the Before Date value.     </li> </ul>
	• After
	Restriction is valid if the date is after the After Date value.  • Span
	Restriction is valid if the date is before the Before Date value and after After Date value.
	• On  Postviction is valid if the data is one of the Data List values
	Restriction is valid if the date is one of the Date List values.
Before Date	
	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before	
Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	
	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	
	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	
	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instances of the task.
First Time	
Ran	System-supplied; date and time this task first ran.
Last Time	
Ran	System-supplied; date and time the task last ran.
Last	
Instance Duration	System-supplied; amount of time the task took to run the last time it ran.
Lowest	
Instance	System-supplied; shortest amount of time this task has taken to run.
Time	

System-supplied; average amount of time this task takes to run.
System-supplied; longest amount of time this task has taken to run.
System-supplied; number of instances in the database for this task.
This section contains Metadata information about this record.
Universally Unique Identifier of this record.
Name of the user that last updated this record.
Date and time that this record was last updated.
Name of the user that created this record.
Date and time that this record was created.
This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Saves a new task record in the Controller database.
Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Saves a new record in the Controller database and continues to display that record.
Displays empty (except for default values) Details for creating a new task.
Saves updates to the record.
Manually launches the task.
Displays a list of any parent Workflow tasks for this task.
Creates a copy of this task, which you are prompted to rename.

### Delete button

Deletes the current record.

#### Note

You cannot delete a task if it is either:

- Specified in an enabled Trigger.The only task specified in a disabled Trigger.

For pop-up view only; closes the pop-up view of this task. Close

#### Tabs This section identifies the tabs across the top of the Task Details that provide access to additional information about the task.

### **Variables**

Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.

#### **Actions**

Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task.

### Events are:

- Task instance status
- Exit codes
- Late start
- Late finish
- Early finish

### Actions are:

Abort Action	Abort the task if certain events occur. For details, see Abort Actions.
Email Notification	Send an email if certain events occur. For details, see Email Notification Actions.
Set Variable	Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow.
SNMP Notification	Send an email if certain events occur. For details, see SNMP Notification Actions.
System Operation	Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions.

### Virtual Resources

Lists all Virtual Resources to which this task is assigned.

Mutually Exclusive	Lists all tasks that have been set to be mutually exclusive of this task.
Instances	Lists all instances of this task.
Triggers	List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current name="" task="">#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers.</current>
Notes	Lists all notes associated with this record.

# **Viewing a Timer Task Instance**

When a Timer task is launched, the Controller creates a task instance record of that task.

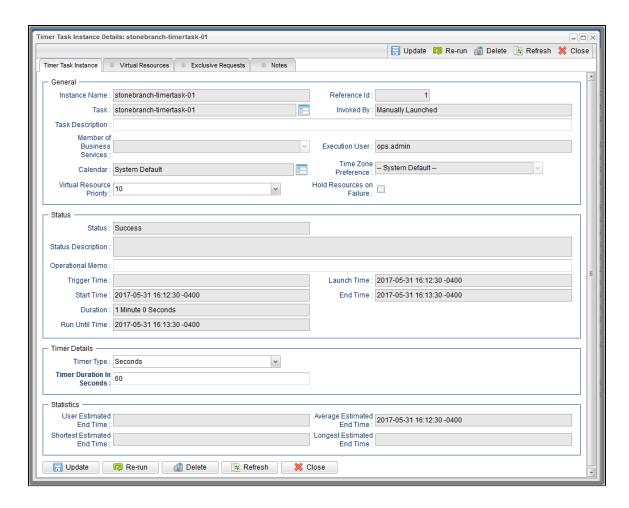

A task instance contains detailed information about a single execution of that task.

You can access a task instance from:

- Instances tab on the Timer Task Details for that task
- Activity list
- Task Instances list

## **Timer Task Instance Details**

The following Timer Task Instance Details contains information on the execution of the task shown in the Timer Task Details.

## **Timer Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in Timer Task Instance Details.

Field Name	Description
General	This section contains general information about the task instance.
Instance Name	Name of this task instance.

Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.
Invoked by	System-supplied; how the task instance was launched.  Options:  Trigger: (Trigger Name) Instance was launched by the named trigger.  Workflow: (Workflow Name) Instance was launched by the named workflow.  Manually Launched Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.

Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)
Critical	Indicates that this task is in the Critical Path of a workflow.
Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.

End Time	System-supplied; Date and time the task instance completed.							
Duration	System-supplied; amount of time the task instance took to run.							
Run Until Time	Calculated run time.							
CPU Time	System-supplied; amount of CPU time the task took to run.							
Timer Details	This section contains assorted detailed information about the task instance.							
Timer Type	User-supplied; the type of Timer command you want to execute.  Options:  • Time  Use the Timer Time field (and, optionally, the Timer Day Constraint field) to specify the time of day that you want the Timer task to be completed.  • Relative Time  Use the Timer Time field (and, optionally, the Timer Day Constraint field) to specify time of day, relative to the Trigger/Launch Time, that you want the Timer task to be completed.  • Duration  Use the Timer Duration field to specify the number of days, hours, minutes, and/or seconds that the Timer task will run.  • Seconds							
Timer Time (HH:MM)	Use the Timer Duration in Seconds field to specify the number of seconds that the Timer task will run.  If Timer Type = Time; Time of day (in 24-hour time) that the Timer task should go to a completed status.							

Timer Day Constraint	If Timer Type = Time or Relative Time; Specification for whether or not to advance the timer to another day.
	Valid values:
	Tuesday If today is not Tuesday, advance to next Monday.  Tuesday If today is not Tuesday, advance to next Tuesday.  Vednesday If today is not Tuesday, advance to next Thursday.  Thursday If today is not Tuesday, advance to next Thursday.  Thursday If today is not Tuesday, advance to next Thursday.  Vednesday If today is not Tuesday, advance to next Thursday.  Vednesday If today is not Tuesday, advance to next Thursday.  Vednesday If today is not Tuesday, advance to next Thursday.  Vednesday If today is not Tuesday, advance to next Thursday.  Vednesday If today is not Tuesday, advance to next Thursday.  Vednesday If today is not Tuesday, advance to next Thursday.  Thursday If today is not Thursday, advance to next Thursday.  Friday If today is not Friday, advance to next Friday.  Saturday  Saturday  Saturday
	If today is not Saturday, advance to next Saturday.  Default is – None
Timer Duration	If Timer Type = Duration; Number of days, hours, minutes, and/or seconds the Timer task will run.
Timer Duration in Seconds	If Timer Type = Seconds; Number of seconds the Timer task will run.
Time Options	This section contains time-related specifications for the task instance.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.

Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.
Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.  Valid values:  - None Advance to the next day if the specified late start time is before the Created time of the task instance Same Day Do not advance day Next Day Advance to the next day Next Business Day Advance to the next business day Sunday If today is not Sunday, advance to next Sunday Monday If today is not Monday, advance to next Monday Tuesday If today is not Tuesday, advance to next Tuesday Wednesday If today is not Wednesday, advance to next Wednesday Thursday If today is not Thursday, advance to next Thursday Friday If today is not Thursday, advance to next Thursday Friday If today is not Friday, advance to next Saturday Saturday If today is not Saturday, advance to next Saturday Nith Day Advance to a specific number of days in the future.  Default is - None
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.

Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.
	For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.
	For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.
Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.

Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.
Constraint	Valid values:  • None Advance to the next day if the specified late finish time is before the Created time of the task instance. • Same Day Do not advance day. • Next Day Advance to the next day. • Next Business Day Advance to the next business day. • Sunday If today is not Sunday, advance to next Sunday. • Monday If today is not Monday, advance to next Monday. • Tuesday If today is not Tuesday, advance to next Tuesday. • Wednesday If today is not Tuesday, advance to next Wednesday. • Thursday If today is not Thursday, advance to next Wednesday. • Thursday If today is not Friday, advance to next Thursday. • Friday If today is not Friday, advance to next Friday. • Saturday If today is not Saturday, advance to next Saturday. • Nth Day Advance to a specific number of days in the future.
	Default is – None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.
Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.

Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  • None Advance to the next day if the specified early finish time is before the Created time of the task instance. • Same Day Do not advance day. • Next Day Advance to the next day, Next Business Day Advance to the next business day. • Sunday If today is not Sunday, advance to next Sunday. • Monday If today is not Monday, advance to next Monday. • Tuesday If today is not Tuesday, advance to next Tuesday. • Wednesday If today is not Tuesday, advance to next Wednesday. • Thursday If today is not Thursday, advance to next Thursday. • Friday If today is not Thursday, advance to next Friday. • Saturday If today is not Friday, advance to next Friday. • Saturday If today is not Saturday, advance to next Saturday. • Nith Day Advance to a specific number of days in the future.  Default is None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.

Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds Minutes Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.
Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.  Options are:  - None - No restriction for this task. Run Restriction for when this task will be run. Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held.  If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.
	Options are:
	<ul> <li>None – No period of restriction for this task.</li> <li>Before Restriction is valid if the date is before the Before Date value.</li> <li>After Restriction is valid if the date is after the After Date value.</li> <li>Span Restriction is valid if the date is before the Before Date value and after After Date value.</li> <li>On Restriction is valid if the date is one of the Date List values.</li> </ul>
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instance.
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.

Updated By	Name of the user that last updated this record.						
Updated	Date and time that this record was last updated.						
Created By	Name of the user that created this record.						
Created	Date and time that this record was created.						
Status History	History of all statuses that the task instance has gone through.						
Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.						
Update	Saves updates to the record.						
Force Finish	See Force Finishing a Task.						
Hold	Places the task instance on Hold (see Putting a Task on Hold).						
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.						
Re-run	See Re-running a Task.						
View Parent	Displays the task instance Details for the parent Workflow of this task instance.						
Delete	Deletes the current record.						
Refresh	Refreshes any dynamic data displayed in the Details.						
Close	For pop-up view only; closes the pop-up view of this task instance.						
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.						
Virtual Resources	Lists all Virtual Resources to which this task is assigned.						
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.						

Notes
-------

Lists all notes associated with this record.

# **Running a Timer Task**

You can run a Timer task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the Timer tasks list or Timer Task Details Action menu.
- As part of a workflow
- Specify triggers that run the task automatically based on times or events.

# **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

## **SQL Task**

- Overview
- Built-In Variables
- Creating a SQL Task
  - SQL Task Details
  - SQL Task Details Field Descriptions
- Viewing a SQL Task Instance
  - SQL Task Instance Details
  - SQL Task Instance Details Field Descriptions
- Running a SQL Task
- Monitoring Task Execution

## Overview

The SQL task allows you to execute one or a series of SQL statements against the database specified in the task.

#### Note

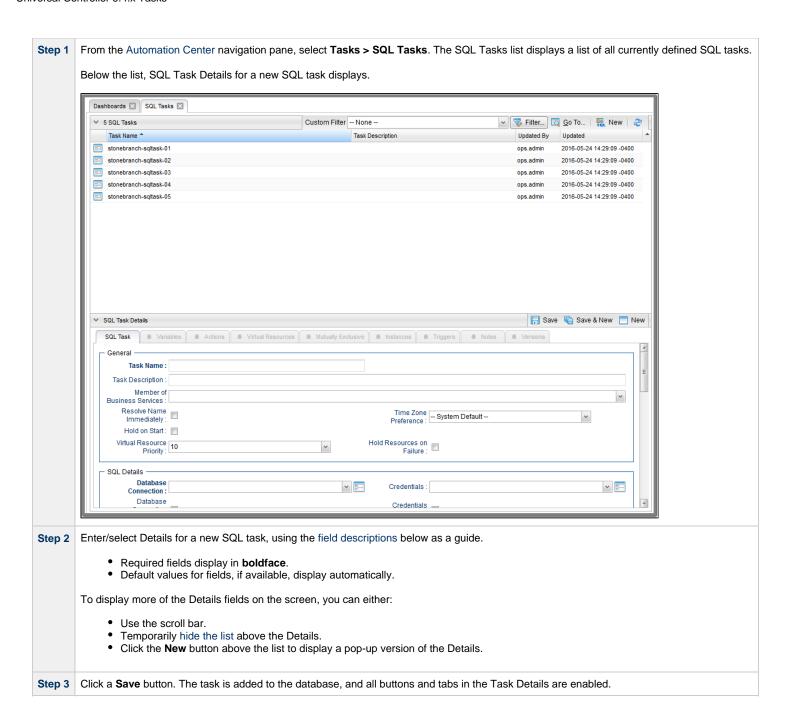

Before you can run a SQL task, you first must create a Database Connection, which defines the information needed to locate and access the database.

## **Built-In Variables**

The following built-in variables can be used in a SQL task to pass data where appropriate:

- Task Instance variables
- SQL Task Instance variables

## **Creating a SQL Task**

#### Note

To open an existing record on the list, either:

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click **Open In Tab** in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

### **SQL Task Details**

The following SQL Task Details is for an existing SQL task.

Depending on the values that you enter / select for these fields, and whether or not the SQL task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the SQL Task Details.

# **SQL Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the SQL Task Details.

Field Name	Description						
General	This section contains general information about the task.						
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.						
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.						
Task Description	Description of this record. (Maximum = 200 characters.)						
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.						
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.						
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server Inherited						
Hold on Start	Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.  If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.						

Hold Reason	Information about why the task will be put on hold when it starts.	
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.	
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.	
SQL Details	This section contains assorted detailed information about the task.	
Database Connection	Name of the Universal Controller Database Connection that defines the database. Select a database from the drop-down list or click the icon to create a new database connection	
Database Connection Variable	Indication of whether the Database Connection field is a reference field for selecting a specific Database Connection (unchecked) or a text field for specifying the Database Connection as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.	
	Note When updating multiple Tasks, to change from using a Database Connection reference to using a Database Connection variable, you must change the Database Connection Variable field to Yes and specify the Database Connection variable in the Database Connection Unresolved field. Conversely, to change from using a Database Connection variable to using a Database Connection variable field to No and specify the Database Connection reference in the Database Connection field.	
Credentials	Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.	
Credentials Variable	Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.	
	Note When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the Credentials Variable field to Yes and specify the Credentials variable in the Credentials Unresolved field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the Credentials Variable field to No and specify the Credentials reference in the Credentials field.	

Maximum Rows	If necessary, specifies a limit to the number of rows you want returned by the SQL/Stored Procedure statement. This value overrides any value you specify in the database connection.  (A default limit can be specified by the SQL/Stored Procedure Maximum Rows Universal Controller system property.)
	If you set Maximum Rows to 0, no content from any of the ResultSets will be retrieved (the next() method on ResultSet will not be called). Each ResultSet will be closed, but no data or rows accessed.
Auto Cleanup	When data is retrieved as the result of a SQL task, the data is written into a database table. If Auto Cleanup is enabled, the data is discarded upon the successful completion of the task (or workflow if the task is contained within a workflow).
SQL Command	SQL command being executed against the database. Variables supported.
Result Processing	Specifies how the Controller should determine whether the SQL command failed or completed successfully.  Options:
	<ul> <li>Skip Result Processing</li> <li>Success Exitcode Range - The SQL command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field.</li> <li>Failure Exitcode Range - The SQL command is considered failed if its exit code falls within the range specified in the Exit Codes field.</li> <li>Success Result Set Contains - The SQL command is considered completed successfully depending on the value in the first row of a specific database column (see Column Name, Operator, and Value fields).</li> <li>Failure Result Set Contains - The SQL command is considered failed depending on the value in the first row of a specific database column (see Column Name, Operator, and Value fields).</li> </ul>
Exit Codes	Required if Result Processing = Success Exitcode Range or Failure Exitcode Range. Specifies the range. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.
Column Name	Required if Result Processing = Success Result Set Contains or Failure Result Set Contains. Specifies the name of a database column that is being checked for a specific value.
Operator	Operator being used for the comparison. Options: =, !=, >, >=, <, <=, regex.
	Note For operators >, >=, <, and <=, if the values being compared are whole numbers between -9223372036854775808 and 9223372036854775807, they will be compared as numbers; otherwise, they will be compared as text lexicographically.
Value	Value being compared, using the operator specified.

### Wait Day Constraint If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day. Valid values: -- None --• If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. Same Day Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Default is - None --. Wait If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task. Duration Wait **Duration In** If Wait To Start = Seconds; Number of seconds to wait before starting the task. Seconds Delay On Start Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified. Options are: None – Duration Seconds

Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  Options are:  System Default     Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.)  Yes     Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  No     Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

## Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Dav Advance to a specific number of days in the future. Default is - None --. Late Start Nth Amount If Late Start Day Constraint = Nth Day; Number of days to advance. Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Late Finish Type	Required if Late Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:
	<ul> <li> None Advance to the next day if the specified late finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday If today is not Thursday, advance to next Wednesday.</li> <li>Friday</li> </ul>
	If today is not Friday, advance to next Friday.  Saturday If today is not Saturday, advance to next Saturday.  Nth Day Advance to a specific number of days in the future.  Default is – None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.
Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.

Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Early Finish Type	Required if Early Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes before the specified time (see Early Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.</li> </ul>
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.
	Valid values:  - None Advance to the next day if the specified early finish time is before the Created time of the task instance Same Day Do not advance day Next Day Advance to the next day Next Business Day Advance to the next business day Sunday If today is not Sunday, advance to next Sunday Monday If today is not Monday, advance to next Monday Tuesday If today is not Tuesday, advance to next Tuesday Wednesday If today is not Usednesday, advance to next Wednesday Thursday If today is not Thursday, advance to next Thursday Firiday If today is not Thursday, advance to next Thursday Firiday If today is not Friday, advance to next Friday Saturday If today is not Saturday, advance to next Saturday Nth Day Advance to a specific number of days in the future.  Default is - None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.

Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds Minutes Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.

# Execution Restriction Specification for whether or not there is a restriction for this task to be run, skipped, or held. Options are: -- None -- No restriction for this task. • Run Restriction for when this task will be run. • Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held. If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow. Restriction Period If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted. Options are: None – No period of restriction for this task. Restriction is valid if the date is before the Before Date value. Restriction is valid if the date is after the After Date value. Restriction is valid if the date is before the Before Date value and after After Date value. On Restriction is valid if the date is one of the Date List values. Before Date If Restriction Period = Before or Span; Date before which the restriction is valid. Before Time If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid. After Date If Restriction Period = After or Span; Date after which the restriction is valid. After Time If Restriction Period = After or Span; Time on the selected date after which the restriction is valid. Date List If Restriction Period = On; Date(s) on which the restriction is valid. **Statistics** This section contains time-related statistics for task instances of the task.

First Time Ran	System-supplied; date and time this task first ran.
Last Time Ran	System-supplied; date and time the task last ran.
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.
Lowest Instance Time	System-supplied; shortest amount of time this task has taken to run.
Average Instance Time	System-supplied; average amount of time this task takes to run.
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.
Number of Instances	System-supplied; number of instances in the database for this task.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Buttons	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Save	Saves a new task record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new task.
Update	Saves updates to the record.

Launch Task	Manually launches the task.			
View Parents	Displays a list of any parent Workflow tasks for this task.			
Сору	Creates a copy of this task, which you are prompted to rename.			
Delete	Deletes the current record.  Note You cannot delete a task if it is either:  Specified in an enabled Trigger.  The only task specified in a disabled Trigger.			
Refresh	Refreshes any dynamic data displayed in the Details.			
Close	For pop-up view only; closes the pop-up view of this task.			
Tabs				
	This section identifies the tabs across the top of the Task Details that provide access to additional information about the task.			
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.			

Actions	Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task.  Events are:  Task instance status Exit codes Late start Late finish Early finish  Actions are:		
	Abort Action	Abort the task if certain events occur. For details, see Abort Actions.	
	Email Notification	Send an email if certain events occur. For details, see Email Notification Actions.	
	Set Variable	Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow.	
	SNMP Notification	Send an email if certain events occur. For details, see SNMP Notification Actions.	
	System Operation	Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions.	
Virtual Resources	Lists all Virtual Reso	ources to which this task is assigned.	
Mutually Exclusive	Lists all tasks that have been set to be mutually exclusive of this task.		
Instances	Lists all instances of the task.		
Triggers	List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current name="" task="">#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers.</current>		
Notes	Lists all notes assoc	ciated with this record.	
Versions	Stores copies of all	previous versions of the current record. See Record Versioning.	

# Viewing a SQL Task Instance

When a SQL task is launched, the Controller creates a task instance record of that task.

A task instance contains detailed information about a single execution of that task.

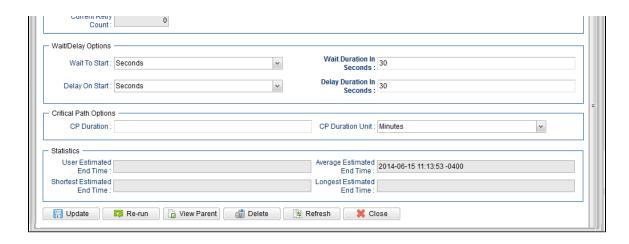

You can access a task instance from:

- Instances tab on the SQL Task Details for that task
- Activity Monitor
- Task Instances list

# **SQL Task Instance Details**

The following SQL Task Instance Details contains information on the execution of a SQL task.

SQL Task Instance Detail	ls: ecu-select-all-zos-criteria

# **SQL Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the SQL Task Instance Details.

Field Name	Description
General	This section contains general information about the task instance.
Instance Name	Name of this task instance.
Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.
Invoked by	System-supplied; how the task instance was launched.  Options:  Trigger: (Trigger Name)     Instance was launched by the named trigger.  Workflow: (Workflow Name)     Instance was launched by the named workflow.  Manually Launched     Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.

Task Description	Description of this record. (Maximum = 200 characters.)
Description	Description of this record. (Waximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.
	Options:
	<ul> <li>System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> </ul>
	<ul> <li>Server (xxx)         Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.</li> </ul>
	<ul> <li>Inherited         Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.     </li> </ul>
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).
	Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).
Status Description	System-supplied; additional information, if any, about the status of the task instance.

Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)
Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.
End Time	System-supplied; Date and time the task instance completed.
Duration	System-supplied; amount of time the task instance took to run.
SQL State	System-supplied; resolves to a return code that indicates the outcome of the most recently executed SQL statement.
Rows Retrieved	System-supplied; number of rows retrieved by the SQL procedure.
SQL Error Message	System-supplied; any error messages returned by the SQL procedure.
SQL Details	This section contains assorted detailed information about the task instance.

Database Connection	Name of the Universal Controller Database Connection that defines the database. Select a database from the drop-down list or click the icon to create a new database connection.		
Database Connection Variable	Indication of whether the Database Connection field is a reference field for selecting a specific Database Connection (unchecked) or a text field for specifying the Database Connection as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.		
	Note When updating multiple Tasks, to change from using a Database Connection reference to using a Database Connection variable, you must change the Database Connection Variable field to Yes and specify the Database Connection variable in the Database Connection Unresolved field. Conversely, to change from using a Database Connection variable to using a Database Connection reference, you must change the Database Connection Variable field to No and specify the Database Connection reference in the Database Connection field.		
Credentials	Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.		
Credentials Variable	Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.		
	Note When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the Credentials Variable field to Yes and specify the Credentials variable in the Credentials Unresolved field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the Credentials Variable field to No and specify the Credentials reference in the Credentials field.		
Maximum Rows	If necessary, specifies a limit to the number of rows you want returned by the SQL/Stored Procedure statement. This value overrides any value you specify in the database connection.		
	(A default limit can be specified by the SQL/Stored Procedure Maximum Rows Universal Controller system property.)		
	If you set Maximum Rows to 0, no content from any of the ResultSets will be retrieved (the next() method on ResultSet will not be called). Each ResultSet will be closed, but no data or rows accessed.		
Auto Cleanup	When data is retrieved as the result of a SQL task, the data is written into a database table. If Auto Cleanup is enabled, the data is discarded upon the successful completion of the task (or workflow if the task is contained within a workflow).		
SQL			

Result Processing	Specifies how the Controller should determine whether the SQL command failed or completed successfully.	
	<ul> <li>Skip Result Processing</li> <li>Success Exitcode Range - The SQL command is considered completed successfully if its exit code falls within the range specified in the Exit Codes field.</li> <li>Failure Exitcode Range - The SQL command is considered failed if its exit code falls within the range specified in the Exit Codes field.</li> <li>Success Result Set Contains - The SQL command is considered completed successfully depending on the value in the first row of a specific database column (see Column Name, Operator, and Value fields).</li> <li>Failure Result Set Contains - The SQL command is considered failed depending on the value in the first row of a specific database column (see Column Name, Operator, and Value fields).</li> </ul>	
Exit Codes	Required if Result Processing = Success Exitcode Range or Failure Exitcode Range. Specifies the range. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.	
Column Name	Required if Result Processing = Success Result Set Contains or Failure Result Set Contains. Specifies the name of a database column that is being checked for a specific value.	
Operator	Operator being used for the comparison. Options: =, !=, >, >=, <, <=, regex.	
	Note For operators >, >=, <, and <=, if the values being compared are whole numbers between -9223372036854775808 and 9223372036854775807, they will be compared as numbers; otherwise, they will be compared as text lexicographically.	
Value	Value being compared, using the operator specified.	
Retry Options	This section contains specifications for retrying the task.	
Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.	
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.	
Retry Interval (Seconds)	User-defined; number of seconds between each retry.	
Current Retry Count	System-supplied; current number of times that the Controller has retried the task after it first went to failure status.	

Wait Time	<ul> <li>- None -</li> <li>Time</li> <li>Relative Time</li> <li>Duration</li> <li>Seconds</li> </ul>
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.  Options are:
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Next Retry Time	System-supplied for a task instance in the Failed status that is scheduled for automatic retry; Next time that a retry will be made. If a task instance is not scheduled for automatic retry, Next Retry Time does not display in the task instance Details.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:  • All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.  • Workflow conditional path processing; any Successors waiting on a failure path will not be released.  • Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which Suppress Intermediate Failures has been enabled.  • Any Workflow containing the Failed task instance will not transition to the Running/Problems status.

### Wait Day Constraint If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day. Valid values: -- None --• If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. Same Day Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Default is - None --. Wait If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task. Duration Wait Duration In If Wait To Start = Seconds; Number of seconds to wait before starting the task. Seconds Delay On Start Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified. Options are: None – Duration Seconds

Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Time Options	This section contains time-related specifications for the task instance.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.

### Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Dav Advance to a specific number of days in the future. Default is - None --. Late Start Nth Amount If Late Start Day Constraint = Nth Day; Number of days to advance. Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • - None - Advance to the next day if the specified late finish time is before the Created time of the task instance. • Same Day Do not advance day. • Next Day Advance to the next day. • Next Business Day Advance to the next business day. • Sunday If today is not Sunday, advance to next Sunday. • Monday If today is not Monday, advance to next Monday. • Tuesday If today is not Tuesday, advance to next Tuesday. • Wednesday If today is not Wednesday, advance to next Wednesday. • Thursday If today is not Thursday, advance to next Thursday. • Friday If today is not Tuesday, advance to next Triusday. • Friday If today is not Friday, advance to next Friday. • Saturday If today is not Friday, advance to next Saturday. • Nth Day Advance to a specific number of days in the future.  Default is - None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:
	<ul> <li>Time - Flag the task if it finishes before the specified time (see Early Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.</li> </ul>
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  • None Advance to the next day if the specified early finish time is before the Created time of the task instance.  • Same Day Do not advance day.  • Next Day Advance to the next day.  • Next Business Day Advance to the next business day.  • Sunday If today is not Sunday, advance to next Sunday.  • Monday If today is not Monday, advance to next Monday.  • Tuesday If today is not Tuesday, advance to next Tuesday.  • Wednesday If today is not Wednesday, advance to next Wednesday.  • Thursday If today is not Thursday, advance to next Thursday.  • Thursday If today is not Thursday, advance to next Thursday.  • Friday If today is not Friday, advance to next Friday.  • Saturday If today is not Saturday, advance to next Saturday.  • Nth Day Advance to a specific number of days in the future.
	Default is – None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.

# CP Duration (Resolved)

Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.

#### CP Duration Unit

Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select **Minutes** in this field.

#### Options:

- Seconds
- Minutes
- Hours

#### Default is Minutes.

# Workflow Execution Options

This section contains Execution Restriction specifications for the task if it is within a Workflow.

# Execution Restriction

Specification for whether or not there is a restriction for this task to be run, skipped, or held.

#### Options are:

- -- None -- No restriction for this task.
- Run Restriction for when this task will be run.
- Skip Restriction for when this task will be skipped.
- Hold Restriction for when this task will be held.

If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

#### Restriction Period

If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.

#### Options are:

- None
  - No period of restriction for this task.
- Before
  - Restriction is valid if the date is before the Before Date value.
- After
  - Restriction is valid if the date is after the After Date value.
- Span
- Restriction is valid if the date is before the Before Date value and after After Date value.
- On

Restriction is valid if the date is one of the Date List values.

Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instance.
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Status	History of all statuses that the task instance has gone through.

Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.
Update	Saves updates to the record.
Force Finish	See Force Finishing a Task.
Hold	Places the task instance on Hold (see Putting a Task on Hold).
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.
Re-run	See Re-running a Task.
View Parent	Displays the task instance Details for the parent Workflow of this task instance.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task instance.
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.
SQL Results	Stores results of executed SQL statements, if any.
SQL Warnings	Warnings returned by executed SQL statements, if any.
Virtual Resources	Lists all Virtual Resources to which this task is assigned.
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.
Notes	Lists all notes associated with this record.

# Running a SQL Task

You can run a SQL task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the SQL tasks list or SQL Task Details Action menu.
  As part of a workflow.
  Specify triggers that run the task automatically based on times or events.

# **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

# **Stored Procedure Task**

- Monitoring Task Execution

### Overview

A Stored Procedure task allows you to execute a stored procedure against the database specified in the task.

#### Note

Before you can run a Stored Procedure task, you first must create a Database Connection, which defines the information needed to locate and access the database.

### **Built-In Variables**

The following built-in variables can be used in a Stored Procedure task to pass data where appropriate:

- Task Instance variables
- Stored Procedure Task Instance variables

# **Creating a Stored Procedure Task**

From the Automation Center navigation pane, select Tasks > Stored Procedure Tasks. The Stored Procedure Tasks list displays a list of all currently defined Stored Procedure tasks. Below the list, Stored Procedure Task Details for a new Stored Procedure task displays. Dashboards 🛛 Stored Procedure Tasks 🖾 Custom Filter -- None --∨ Filter... 🔯 Go To... | 👔 New | 🍣 ▼ 5 Stored Procedure Tasks Task Name ^ Task Description Stored Procedure Name Updated By stonebranch-storedproceduretask-01 2016-05-24 14:29:09 -0400 procedure 1 ops.admin stonebranch-storedproceduretask-02 procedure 1 ops.admin 2016-05-24 14:29:09 -0400 stonebranch-storedproceduretask-03 procedure 1 ops.admin 2016-05-24 14:29:09 -0400 2016-05-24 14:29:09 -0400 stonebranch-storedproceduretask-04 procedure 1 ops.admin procedure 1 ops.admin 2016-05-24 14:29:09 -0400 🔚 Save 🎼 Save & New 📃 New Stored Procedure Task Details

Hold on Start : 🔲

Virtual Resource 10 Priority:

Stored Procedure Details Database

> Connection: Database

- Temporarily hide the list above the Details.
- Click the **New** button above the list to display a pop-up version of the Details.

Step 3 Click a Save button. The task is added to the database, and all buttons and tabs in the Task Details are enabled.

#### Note

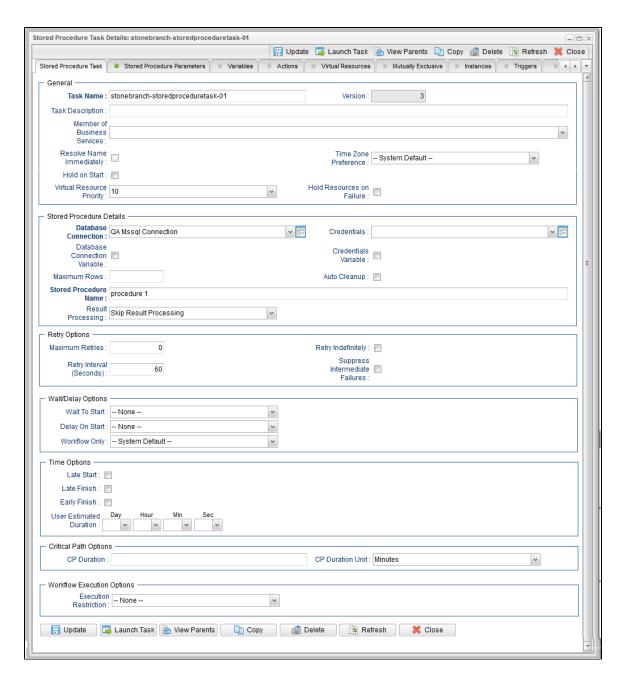

To open an existing record on the list, either:

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click **Open In Tab** in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

### **Stored Procedure Task Details**

The following Stored Procedure Task Details is for an existing Stored Procedure task.

Depending on the values that you enter / select for these fields, and whether or not the Stored Procedure task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the Stored Procedure Task Details.

**Stored Procedure Task Details Field Descriptions** 

The following table describes the fields, buttons, and tabs that display in the Stored Procedure Task Details.

task.
hanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
ord, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions.
ers.)
ness Services that this record belongs to.
vill be resolved immediately at trigger/launch time.
at will be applied to the task.
k Timezone Preference Universal Controller system property: Server or Inherited. er; time zone is evaluated in the time zone of the server. the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
he Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.
hen it starts.
asks are waiting for the resource. This priority applies to all resources required by the task.

Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Stored Procedure Details	This section contains assorted detailed information about the task.
Database Connection	Name of the Universal Controller Database Connection that defines the database. Select a database from the drop-down list or click the icon to create a new database connection.
Database Connection Variable	Indication of whether the Database Connection field is a reference field for selecting a specific Database Connection (unchecked) or a text field for specifying the Database Connection as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using a Database Connection reference to using a Database Connection variable, you must change the Database Connection Variable field to Yes and specify the Database Connection variable in the Database Connection Unresolved field. Conversely, to change from using a Database Connection variable to using a Database Connection reference, you must change the Database Connection Variable field to No and specify the Database Connection reference in the Database Connection field.
Credentials	Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.
Credentials Variable	Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the Credentials Variable field to Yes and specify the Credentials variable in the Credentials Unresolved field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the Credentials Variable field to No and specify the Credentials reference in the Credentials field.
Maximum Rows	If necessary, specifies a limit to the number of rows you want returned by the SQL/Stored Procedure statement. This value overrides any value you specify in the database connection.
	(A default limit can be specified by the SQL/Stored Procedure Maximum Rows Universal Controller system property.)
	If you set Maximum Rows to 0, no content from any of the ResultSets will be retrieved (the next() method on ResultSet will not be called). Each ResultSet will be closed, but no data or rows accessed.

Auto Cleanup	When data is retrieved as the result of a SQL task, the data is written into a database table. If Auto Cleanup is enabled, the data is discarded upon the successful completion of the task (or workflow if the task is contained within a workflow).
Stored Procedure Name	Name of the file containing the stored procedure being executed against the database. Variables supported.
Result Processing	Specifies how the Controller should determine whether the Stored Procedure failed or completed successfully.  Options:  Skip Result Processing. Success Exitcode Range - The Stored Procedure is considered completed successfully if its exit code falls within the range specified in the Exit Codes field. Failure Exitcode Range - The Stored Procedure is considered failed if its exit code falls within the range specified in the Exit Codes field. Success Result Set Contains - The Stored Procedure is considered completed successfully depending on the value in a specific database column (see Column Name, Operator, and Value fields). Failure Result Set Contains - The Stored Procedure is considered failed depending on the value in a specific database column (see Column Name, Operator, and Value fields). Success Output Parameter - The Stored Procedure is considered completed successfully if its output parameter satisfies the condition specified in the associated Parameter Position, Operator, and Value fields. Failure Output Parameter - The Stored Procedure is considered failed if its output parameter satisfies the condition specified in the associated Parameter Position, Operator, and Value fields.
Exit Codes	Required if Result Processing = Success Exitcode Range or Failure Exitcode Range. Specifies the range. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30.
Parameter Position	If Result Processing = Success Output Parameter or Failure Output Parameter; position of this parameter within a list of parameters.
Operator	Operator being used for the comparison. Options: =, !=, >, >=, <, <=, regex.  Note For operators >, >=, <, and <=, if the values being compared are whole numbers between -9223372036854775808 and 9223372036854775807, they will be compared as numbers; otherwise, they will be compared as text lexicographically.
Value	Value being compared, using the operator specified.
Column Name	Required if Result Processing = Success Result Set Contains or Failure Result Set Contains. Specifies the name of a database column that is being checked for a specific value.

Operator	Operator being used for the comparison. Options: =, !=, >, >=, <, <=, regex.
	Note For operators >, >=, <, and <=, if the values being compared are whole numbers between -9223372036854775808 and 9223372036854775807, they will be compared as numbers; otherwise, they will be compared as text lexicographically.
Value	Value being compared, using the operator specified.
Retry Options	This section contains specifications for retrying the task.
Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval (Seconds)	User-defined; number of seconds between each retry.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:
	<ul> <li>All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.</li> </ul>
	<ul> <li>Workflow conditional path processing; any Successors waiting on a failure path will not be released.</li> </ul>
	• Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which <b>Suppress Intermediate Failures</b> has been enabled.
	Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.

Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	<ul> <li>None –</li> <li>Time</li> <li>Relative Time</li> </ul>
	<ul><li>Duration</li><li>Seconds</li></ul>
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	<ul> <li> None</li> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> <li>Same Day</li></ul>
	<ul> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> </ul>
	<ul> <li>Saturday         If today is not Saturday, advance to next Saturday.     </li> </ul>
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.

Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.
	Options are:
	<ul> <li>None –</li> <li>Duration</li> <li>Seconds</li> </ul>
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.
	Options are:
	• System Default
	Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is <b>yes</b> .)  • Yes
	Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  • No
	Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.
	Options:
	<ul> <li>Time - Flag the task if it starts after the specified time.</li> <li>Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.</li> </ul>

If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.
If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.  Valid values:
- None Advance to the next day if the specified late start time is before the Created time of the task instance.  Same Day Do not advance day.  Next Day Advance to the next day.  Next Business Day Advance to the next day.  Sunday If today is not Sunday, advance to next Sunday.  Monday If today is not Monday, advance to next Monday.  Tuesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Tuesday, advance to next Wednesday.  Thursday If today is not Tuesday, advance to next Wednesday.  Thursday If today is not Thursday, advance to next Thursday.  Thursday If today is not Friday, advance to next Friday.  Saturday If today is not Saturday, advance to next Saturday.  Nth Day Advance to a specific number of days in the future.  Default is – None
If Late Start Day Constraint = Nth Day; Number of days to advance.
If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.  For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.  For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes

Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  • None Advance to the next day if the specified early finish time is before the Created time of the task instance.  • Same Day Do not advance day. • Next Day Advance to the next day. • Next Business Day Advance to the next business day. • Sunday If today is not Sunday, advance to next Sunday. • Monday If today is not Monday, advance to next Monday. • Tuesday If today is not Tuesday, advance to next Wednesday. • Thursday If today is not Wednesday, advance to next Wednesday. • Thursday If today is not Tuesday, advance to next Thursday. • Friday If today is not Thursday, advance to next Friday. • Saturday If today is not Saturday, advance to next Saturday. • Nith Day Advance to a specific number of days in the future.  Default is - None

Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.
	Seconds     Minutes     Hours  Default is Minutes.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
Critical Path Options	This section contains Critical Path-related specifications for the task.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.

# Execution Restriction Specification for whether or not there is a restriction for this task to be run, skipped, or held. Options are: -- None -- No restriction for this task. • Run Restriction for when this task will be run. • Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held. If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow. Restriction Period If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted. Options are: None – No period of restriction for this task. Restriction is valid if the date is before the Before Date value. Restriction is valid if the date is after the After Date value. Restriction is valid if the date is before the Before Date value and after After Date value. On Restriction is valid if the date is one of the Date List values. Before Date If Restriction Period = Before or Span; Date before which the restriction is valid. Before Time If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid. After Date If Restriction Period = After or Span; Date after which the restriction is valid. After Time If Restriction Period = After or Span; Time on the selected date after which the restriction is valid. Date List If Restriction Period = On; Date(s) on which the restriction is valid. **Statistics** This section contains time-related statistics for task instances of the task.

First Time Ran	System-supplied; date and time this task first ran.
Last Time Ran	System-supplied; date and time the task last ran.
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.
Lowest Instance Time	System-supplied; shortest amount of time this task has taken to run.
Average Instance Time	System-supplied; average amount of time this task takes to run.
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.
Number of Instances	System-supplied; number of instances in the database for this task.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Buttons	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Save	Saves a new task record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new task.
Update	Saves updates to the record.

Launch Task	Manually launches the task.				
View Parents	Displays a list of any parent Workflow tasks for this task.				
Сору	Creates a copy of this task, which you are prompted to rename.				
Delete	Deletes the current record.				
	<ul> <li>Note         You cannot delete a task if it is either:         <ul> <li>Specified in an enabled Trigger.</li> <li>The only task specified in a disabled Trigger.</li> </ul> </li> </ul>				
Refresh	Refreshes any dynamic data displayed in the Details.				
Close	For pop-up view only; closes the pop-up view of this task.				
Tabs	This section identifies the tabs across the top of the Task Details that provide access to additional information about the task instance.				
Stored Procedure Parameters	See Adding Stored Procedure Parameters, below.				
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.				

Actions	Allows you to specify  Events are:  Task instance Exit codes Late start Late finish Early finish  Actions are:	y actions that the Controller will take automatically based on events that occur during the execution of this task.			
	Abort Action	Abort the task if certain events occur. For details, see Abort Actions.			
	Email Notification	Send an email if certain events occur. For details, see Email Notification Actions.			
	Set Variable	Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow.			
	SNMP Send an email if certain events occur. For details, see SNMP Notification Actions.  Notification				
	System Operation  Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions.				
Virtual Resources	Lists all Virtual Reso	ources to which this task is assigned.			
Mutually Exclusive	Lists all tasks that have been set to be mutually exclusive of this task.				
Instances	Lists all instances of the task.				
Triggers	triggers. If you add a	at reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current name="" task="">#TRIGGER#. You can change the red. For instructions on creating triggers, see Triggers.</current>			
Notes	Lists all notes assoc	iated with this record.			
Versions	Stores copies of all previous versions of the current record. See Record Versioning.				

# **Viewing a Stored Procedure Task Instance**

When a Stored Procedure task is launched, the Controller creates a task instance record of that task.

A task instance contains detailed information about a single execution of that task.

You can access a task instance from:

- Instances tab on the Stored Procedure Task Details for that task
- Activity Monitor
- Task Instances list

### **Stored Procedure Task Instance Details**

The following Stored Procedure Task Instance Details contains information on the execution of the task shown in the Stored Procedure Task Details.

# **Stored Procedure Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in Stored Procedure Task Instance Details.

Field Name	Description
General	This section contains general information about the task instance.
Instance Name	Name of this task instance.
Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.
Invoked by	System-supplied; how the task instance was launched.  Options:  Trigger: (Trigger Name)
	<ul> <li>Instance was launched by the named trigger.</li> <li>Workflow: (Workflow Name) Instance was launched by the named workflow.</li> <li>Manually Launched Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.</li> </ul>
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.

Calendar	Calendar associated with the task instance.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)
Critical	Indicates that this task is in the Critical Path of a workflow.

Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.
End Time	System-supplied; Date and time the task instance completed.
Duration	System-supplied; amount of time the task instance took to run.
SQL State	System-supplied; resolves to a return code that indicates the outcome of the most recently executed SQL statement.
Rows Retrieved	System-supplied; number of rows retrieved by the SQL procedure.
SQL Error Message	System-supplied; any error messages returned by the SQL procedure.
Stored Procedure Details	This section contains assorted detailed information about the task instance.
Database Connection	Name of the Universal Controller Database Connection that defines the database. Select a database from the drop-down list or click the icon to create a new database connection.

### Database Connection Variable

Indication of whether the Database Connection field is a reference field for selecting a specific Database Connection (unchecked) or a text field for specifying the Database Connection as a variable (checked). Use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Database Connection reference to using a Database Connection variable, you must change the **Database Connection Variable** field to **Yes** and specify the Database Connection variable in the **Database Connection Unresolved** field. Conversely, to change from using a Database Connection variable to using a Database Connection variable field to **No** and specify the Database Connection reference in the **Database Connection** field.

### Credentials

Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.

### Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials Variable** field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

### Maximum Rows

If necessary, specifies a limit to the number of rows you want returned by the SQL/Stored Procedure statement. This value overrides any value you specify in the database connection.

(A default limit can be specified by the SQL/Stored Procedure Maximum Rows Universal Controller system property.)

If you set Maximum Rows to 0, no content from any of the ResultSets will be retrieved (the next() method on ResultSet will not be called). Each ResultSet will be closed, but no data or rows accessed.

### Auto Cleanup

When data is retrieved as the result of a SQL task, the data is written into a database table. If Auto Cleanup is enabled, the data is discarded upon the successful completion of the task (or workflow if the task is contained within a workflow).

### Stored Procedure Name

Name of the file containing the stored procedure being executed against the database. Variables supported.

# Result Processing Specifies how the Controller should determine whether the Stored Procedure failed or completed successfully. Options: Skip Result Processing. • Success Exitcode Range - The Stored Procedure is considered completed successfully if its exit code falls within the range specified in the Exit Codes field. • Failure Exitcode Range - The Stored Procedure is considered failed if its exit code falls within the range specified in the Exit Codes field. Success Result Set Contains - The Stored Procedure is considered completed successfully depending on the value in a specific database column (see Column Name, Operator, and Value fields). • Failure Result Set Contains - The Stored Procedure is considered failed depending on the value in a specific database column (see Column Name, Operator, and Value • Success Output Parameter - The Stored Procedure is considered completed successfully if its output parameter satisfies the condition specified in the associated Parameter Position, Operator, and Value fields. • Failure Output Parameter - The Stored Procedure is considered failed if its output parameter satisfies the condition specified in the associated Parameter Position, Operator, and Value fields. Parameter If Result Processing = Success Output Parameter or Failure Output Parameter; position of this parameter within a list of parameters. Position Operator Operator being used for the comparison. Options: =, !=, >, >=, <, <=, regex. Note For operators >, >=, <, and <=, if the values being compared are whole numbers between -9223372036854775808 and 9223372036854775807, they will be compared as numbers; otherwise, they will be compared as text lexicographically. Value Value being compared, using the operator specified. Exit Codes Required if Result Processing = Success Exitcode Range or Failure Exitcode Range. Specifies the range. Format: Numeric. Use commas to list a series of exit codes; use hyphens to specify a range. Example: 1,5, 22-30. Column Name Required if Result Processing = Success Result Set Contains or Failure Result Set Contains. Specifies the name of a database column that is being checked for a specific value. Operator Operator being used for the comparison. Options: =, !=, >, >=, <, <=, regex. For operators >, >=, <, and <=, if the values being compared are whole numbers between -9223372036854775808 and 9223372036854775807, they will be compared as numbers; otherwise, they will be compared as text lexicographically.

Value	Value being compared, using the operator specified.
Retry Options	This section contains specifications for retrying the task.
Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
Retry Interval (Seconds)	User-defined; number of seconds between each retry.
Current Retry Count	System-supplied; current number of times that the Controller has retried the task after it first went to failure status.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:  • All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.  • Workflow conditional path processing; any Successors waiting on a failure path will not be released.  • Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which Suppress Intermediate Failures has been enabled.  • Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
Next Retry Time	System-supplied for a task instance in the Failed status that is scheduled for automatic retry; Next time that a retry will be made. If a task instance is not scheduled for automatic retry, Next Retry Time does not display in the task instance Details.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.

Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	<ul> <li>None –</li> <li>Time</li> <li>Relative Time</li> </ul>
	<ul><li>Duration</li><li>Seconds</li></ul>
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	• None
	<ul> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> <li>Same Day</li> </ul>
	Do not advance day.  Next Day Advance to the next day.  Next Business Day
	Advance to the next business day.  Sunday If today is not Sunday, advance to next Sunday.
	<ul> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday</li> </ul>
	If today is not Tuesday, advance to next Tuesday.  • Wednesday
	If today is not Wednesday, advance to next Wednesday.  Thursday  If today is not Thursday, advance to next Thursday.
	Friday     If today is not Friday, advance to next Friday.
	Saturday If today is not Saturday, advance to next Saturday.
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.

Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.  Options are:  - None -  Duration Seconds
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Time Options	This section contains time-related specifications for the task instance.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

### Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Dav Advance to a specific number of days in the future. Default is - None --. Late Start Nth Amount If Late Start Day Constraint = Nth Day; Number of days to advance. Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None     Advance to the next day if the specified late finish time is before the Created time of the task instance.  • Same Day     Do not advance day.  • Next Day     Advance to the next day.  • Next Business Day     Advance to the next business day.  • Sunday     If today is not Sunday, advance to next Sunday.  • Monday     If today is not Monday, advance to next Monday.  • Tuesday     If today is not Tuesday, advance to next Tuesday.  • Wednesday     If today is not Tuesday, advance to next Wednesday.  • Thursday     If today is not Tursday, advance to next Wednesday.  • Thursday     If today is not Tursday, advance to next Thursday.  • Friday     If today is not Friday, advance to next Friday.  • Saturday     If today is not Saturday, advance to next Saturday.  • Nth Day     Advance to a specific number of days in the future.  Default is - None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:
	<ul> <li>Time - Flag the task if it finishes before the specified time (see Early Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.</li> </ul>
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  • None     Advance to the next day if the specified early finish time is before the Created time of the task instance.  • Same Day     Do not advance day.  • Next Day     Advance to the next day.  • Next Business Day     Advance to the next business day.  • Sunday     If today is not Sunday, advance to next Sunday.  • Monday     If today is not Monday, advance to next Monday.  • Tuesday     If today is not Tuesday, advance to next Tuesday.  • Wednesday     If today is not Thursday, advance to next Wednesday.  • Thursday     If today is not Thursday, advance to next Thursday.  • Friday     If today is not Friday, advance to next Friday.  • Saturday     If today is not Friday, advance to next Saturday.  • Nith Day     Advance to a specific number of days in the future.  Default is None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.

# CP Duration (Resolved)

Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.

### CP Duration Unit

Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select **Minutes** in this field.

### Options:

- Seconds
- Minutes
- Hours

#### Default is Minutes.

# Workflow Execution Options

This section contains Execution Restriction specifications for the task if it is within a Workflow.

# Execution Restriction

Specification for whether or not there is a restriction for this task to be run, skipped, or held.

#### Options are:

- -- None -- No restriction for this task.
- Run Restriction for when this task will be run.
- Skip Restriction for when this task will be skipped.
- Hold Restriction for when this task will be held.

If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

### Restriction Period

If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.

#### Options are:

- None
  - No period of restriction for this task.
- Before
  - Restriction is valid if the date is before the Before Date value.
- After
  - Restriction is valid if the date is after the After Date value.
- Span
- Restriction is valid if the date is before the Before Date value and after After Date value.
- On

Restriction is valid if the date is one of the Date List values.

Before Date	
20.010 20.0	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instance.
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Status History	History of all statuses that the task instance has gone through.

Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.
Update	Saves updates to the record.
Force Finish	See Force Finishing a Task.
Hold	Places the task instance on Hold (see Putting a Task on Hold).
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.
Re-run	See Re-running a Task.
View Parent	Displays the task instance Details for the parent Workflow of this task instance.
Delete	Deletes the current record.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task instance.
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.
Stored Procedure Parameters	See Adding Stored Procedure Parameters, below.
SQL Results	Stores results of executed SQL statements, if any.
SQL Warnings	Warnings returned by executed SQL statements, if any.
Virtual Resources	Lists all Virtual Resources to which this task is assigned.
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.

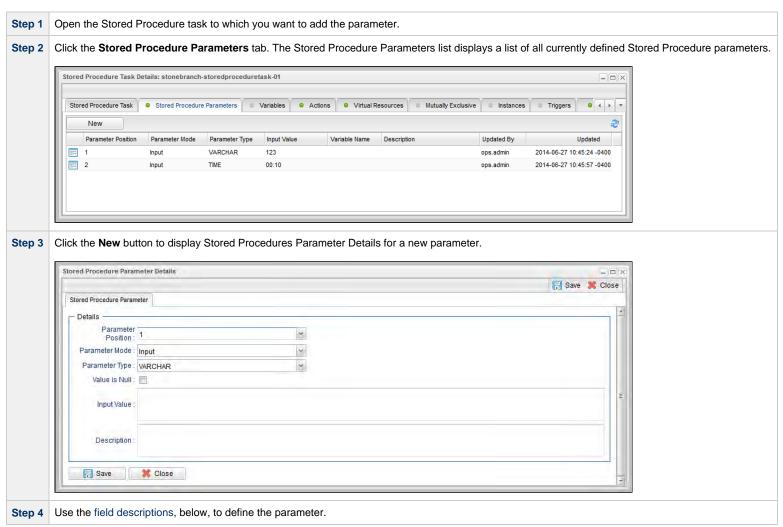

Notes

Lists all notes associated with this record.

# **Adding Stored Procedure Parameters**

You can enter one or more parameters for each stored procedure, as described below.

# **Adding a Parameter**

Step 5 Click the Save button.

# **Stored Procedure Parameter Field Descriptions**

Field Name	Description
Parameter Position	Position of this parameter within a list of parameters.
Parameter Mode	Mode of this parameter.  Options:  Input Output Input/Output
Parameter Type	Type of parameter.  Options:  NUMERIC DECIMAL INTEGER SMALLINT FLOAT REAL DOUBLE VARCHAR BOOLEAN DATE TIME TIME TIME TIMESTAMP BIGINT VARBINARY
Value is Null	If Parameter Mode = Input or Input/Output; Value for the parameter is a database NULL value; applies to the input part of a stored procedure parameter. That is, if a value in a database is undefined, it is NULL, which means it has no set value. An input value can be NULL and is represented by selecting <b>Value is Null</b> .
Input Value	If Parameter Mode = Input or Input/Output; Input value of the parameter, if any.
Description	Description of this parameter.

Variable Scope	If Parameter Mode = Output or Input/Output; applies to parameters associated with a task in a workflow. Scope of the variable to assign the Output value.  Options:
	Self     Parent     Top Level Parent     Global
Variable Name	If Parameter Mode = Output or Input/Output; name of variable to assign the Output value.

# **Deleting a Parameter**

To delete a single parameter, either:

- Right-click the parameter on the Stored Procedure Parameters list and click **Delete** on the Action menu.
- Open the Stored Procedure Parameter record and click the **Delete** button.

# **Running a Stored Procedure Task**

You can run a Stored Procedure task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the Stored Procedure tasks list or Stored Procedure Task Details Action menu.
- As part of a workflow.
- Specify triggers that run the task automatically based on times or events.

# **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

# **Email Task**

- Overview
- Built-In Variables
- Creating an Email Task
  - Email Task Details
  - Email Task Details Field Descriptions
  - Report Variable Resolution
- Viewing an Email Task Instance
  - Email Task Instance Details
  - Email Task Instance Details Field Descriptions
- Running an Email Task
- Monitoring Task Execution

### Overview

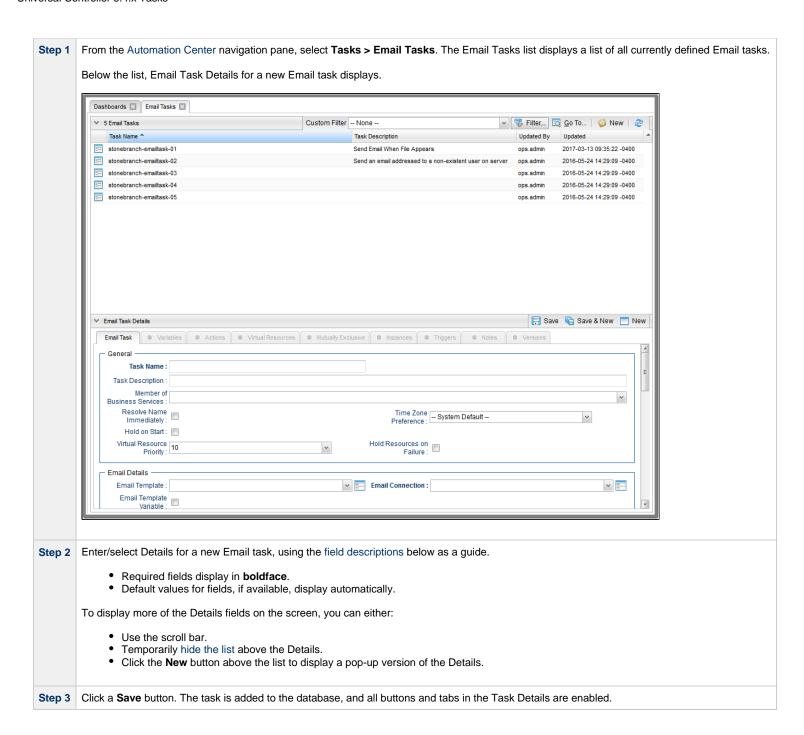

The Email task allows you to create and send emails. In order to execute Email tasks, you first need to define an Email Connection, which defines the server information needed to create and send emails.

### **Built-In Variables**

The following built-in variables can be used in an Email task to pass data where appropriate:

Task Instance variables

# **Creating an Email Task**

### Note

To open an existing record on the list, either:

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click **Open In Tab** in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

### **Email Task Details**

The following Email Task Details is for an existing Email task.

Depending on the values that you enter / select for these fields, and whether or not the Email task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the Email Task Details.

# **Email Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the Email Task Details.

Field Name	Description
General	This section contains general information about the task.
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  • - System Default -
	Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.  Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.  Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.

Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.
Hold Reason	Information about why the task will be put on hold when it starts.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Email Details	This section contains assorted detailed information about the task.
Email Template	Name of an Email template defined in an Email Template Details. An Email template allows you to specify standard recipients and text for outgoing emails. Enter the name of an existing Email template, select an Email template from the drop-down list, or click the Details icon to create a new Email template.
	Every Email template specifies an Email connection. If you do not specify an Email template in this field, you must specify an Email connection in the Email Connection field.
	If you specify both an Email template (in this field) and an Email Connection, the Email server specified in the Email Connection field overrides the Email server specified in this field.
	(Any information specified in an Email task overrides what is specified in an Email template.)
Email Template Variable	Indication of whether the Email Template field is a reference field for selecting a specific Email Template (unchecked) or a text field for specifying the Email Template as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using a Email Template reference to using a Email Template variable, you must change the Email Template Variable field to Yes and specify the Email Template variable in the Email Template Unresolved field. Conversely, to change from using an Email Template variable to using an Email Template reference, you must change the Email Template Variable field to No and specify the Email Template reference in the Email Template field.

Email Connection	Required if an Email Template is not specified in the Email Template field; Name of an outgoing Email Connection (Type = Outgoing). An Email Connection specifies information about an outgoing or incoming email server. Enter the name of an existing outgoing Email Connection, select an existing outgoing Email Connection from the drop-down list, or clear the Email Connection field and click the Details icon to create a new Email Connection (Outgoing will be pre-selected in the Type field).  If you specify both an Email Template and an Email Connection (in this field), the Email Connection specified in this field overrides the Email Connection specified in the Email Template field.
Reply-To	Email address of the sender. Use commas to separate multiple recipients. Variables and functions supported.
То	Email address of the recipient. Use commas to separate multiple recipients. Variables and functions supported.
Сс	Email address of the party being sent a copy of the email, if any. Use commas to separate multiple recipients. Variables and functions supported.
Всс	Email address of the party being sent a blind (hidden) copy of the email, if any. Use commas to separate multiple recipients. Variables and functions supported.
Subject	Subject line of the email. Variables and functions supported.
Body	Text of the email message. Variables and functions supported. If both the email template and the email task contain text in the body, the text is appended.
Report	Report to attach to this email.
Report Variable	Indication of whether the Report field is a reference field for selecting a specific Report (unchecked) or a text field for specifying the Report as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Email Tasks, to change from using a report reference to using a report variable, you must change the Report Variable field to Yes and specify the report variable in the Report Unresolved field. Conversely, to change from using a report variable to a using a report reference, you must change the Report Variable field to No and specify the report reference in the Report field.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.

Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	<ul> <li>None –</li> <li>Time</li> <li>Relative Time</li> <li>Duration</li> </ul>
	• Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	None -  None
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.

Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.
	Options are:
	<ul> <li>None –</li> <li>Duration</li> <li>Seconds</li> </ul>
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.
	Options are:
	<ul> <li> System Default         Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.)</li> <li>Yes</li> </ul>
	Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  • No
	Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.
	Options:
	<ul> <li>Time - Flag the task if it starts after the specified time.</li> <li>Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.</li> </ul>

Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.
Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
	Valid values:
	<ul> <li> None Advance to the next day if the specified late start time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> </ul>
	Next Business Day     Advance to the next business day.
	• Sunday
	If today is not Sunday, advance to next Sunday.  • Monday
	If today is not Monday, advance to next Monday.  • Tuesday
	If today is not Tuesday, advance to next Tuesday.  • Wednesday
	If today is not Wednesday, advance to next Wednesday.
	Thursday     If today is not Thursday, advance to next Thursday.
	Friday  If today is not Friday, advance to next Friday.
	Saturday If today is not Saturday, advance to next Saturday.
	Nth Day
	Advance to a specific number of days in the future.
	Default is – None
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start	
Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.
	For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.
	For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.

Late Finish Type	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.  Required if Late Finish is enabled.  Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None     Advance to the next day if the specified late finish time is before the Created time of the task instance.  • Same Day     Do not advance day.  • Next Day     Advance to the next day.  • Next Business Day     Advance to the next business day.  • Sunday     If today is not Sunday, advance to next Sunday.  • Monday     If today is not Monday, advance to next Monday.  • Tuesday     If today is not Tuesday, advance to next Tuesday.
	<ul> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul> Default is - None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Early Finish Type	Required if Early Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes before the specified time (see Early Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.</li> </ul>
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:
	<ul> <li>None Advance to the next day if the specified early finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday If today is not Tuesday, advance to next Wednesday.</li> <li>Thursday If today is not Thursday, advance to next Wednesday.</li> <li>Thursday If today is not Friday, advance to next Friday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul>
	Default is – None

Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.
	<ul> <li>Seconds</li> <li>Minutes</li> <li>Hours</li> </ul> Default is Minutes.
	Options:  • Seconds
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
Critical Path Options	This section contains Critical Path-related specifications for the task.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.

## Execution Restriction Specification for whether or not there is a restriction for this task to be run, skipped, or held. Options are: -- None -- No restriction for this task. • Run Restriction for when this task will be run. • Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held. If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow. Restriction Period If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted. Options are: • - None -No period of restriction for this task. Restriction is valid if the date is before the Before Date value. Restriction is valid if the date is after the After Date value. Restriction is valid if the date is before the Before Date value and after After Date value. On Restriction is valid if the date is one of the Date List values. Before Date If Restriction Period = Before or Span; Date before which the restriction is valid. Before If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid. Time After Date If Restriction Period = After or Span; Date after which the restriction is valid. After Time If Restriction Period = After or Span; Time on the selected date after which the restriction is valid. Date List If Restriction Period = On; Date(s) on which the restriction is valid. **Statistics** This section contains time-related statistics for task instances of the task.

First Time Ran	System-supplied; date and time this task first ran.
Last Time Ran	System-supplied; date and time the task last ran.
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.
Lowest Instance Time	System-supplied; shortest amount of time this task has taken to run.
Average Instance Time	System-supplied; average amount of time this task takes to run.
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.
Number of Instances	System-supplied; number of instances in the database for this task.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Buttons	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Save	Saves a new Linux/Unix task record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new task.
Update	Saves updates to the record.

Launch Task	Manually launches the task.
View Parents	Displays a list of any parent Workflow tasks for this task.
Сору	Creates a copy of this task, which you are prompted to rename.
Delete	Deletes the current record.  Note You cannot delete a task if it is either:  Specified in an enabled Trigger.  The only task specified in a disabled Trigger.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task.
Tabs	This section identifies the tabs across the top of the Task Details that provide access to additional information about the task.
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.

## Actions Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task. Events are: Task instance status Exit codes Late start Late finish Early finish Actions are: Abort the task if certain events occur. For details, see Abort Actions. **Abort Action** Send an email if certain events occur. For details, see Email Notification Actions. **Email** Notification **Set Variable** Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow. **SNMP** Send an email if certain events occur. For details, see SNMP Notification Actions. Notification Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions. System Operation Virtual Lists all Virtual Resources to which this task is assigned. Resources Mutually Lists all tasks that have been set to be mutually exclusive of this task. **Exclusive** Lists all instances of the task. Instances **Triggers** List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current task name>#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers. Notes Lists all notes associated with this record. Versions Stores copies of all previous versions of the current record. See Record Versioning.

## **Report Variable Resolution**

Reports do not have to be unique by Title. However, Reports with the same Title must be unique per visibility: per User, per Group, and per Everyone.

Accordingly, the following applies regarding Report Variable field resolution.

Once resolved, the Report Variable field value could match multiple Reports with the same Title, but with different visibilities. Therefore, there is an order of precedence to choosing the report by Title:

- 1. User visibility (execution user).
- 2. Group visibility (execution user's groups).
- 3. Everyone visibility.
- 4. Any other report(s). (This is applicable only in the case of an administrator who can view all reports.)

If the execution user belongs to more than one Group, and there is more than one report matching the Title visible to those Groups, the first report found will be chosen.

If multiple reports are found by resolved report Title, the following will be logged:

Found more than one report with name <report-title> visible to execution user <execution-user>.

If the resolved report Title does not match any report visible to the execution user, the task instance will transition into the Start Failure status with the following status description:

Could not find report with name <report-title> visible to execution user <execution-user>.

If the Report Variable cannot be resolved, the task instance will transition into the Start Failure status with the following status description:

Report variable not resolved.

A Report Variable that resolves to blank implies that no report should be included. This is not considered an error; the task instance will proceed as normal.

## Viewing an Email Task Instance

When an Email task is launched, the Controller creates a task instance record of that task.

A task instance contains detailed information about a single execution of that task.

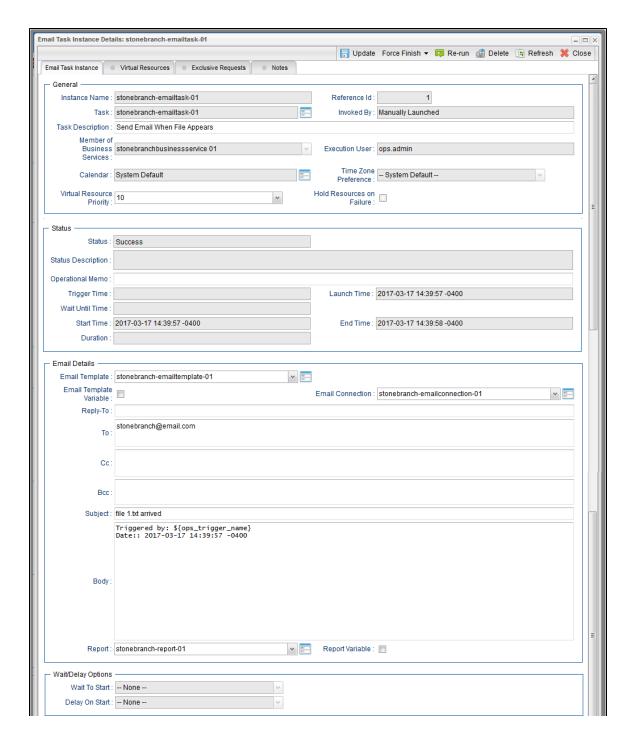

You can access a task instance from:

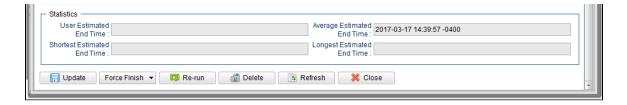

- Instances tab on the Email Task Details for that task
- Activity Monitor

Task Instances list

## **Email Task Instance Details**

The following Email Task Instance Details contains information on the execution of the task shown in the Email Task Details.

## **Email Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in Email Task Instance Details.

Field Name	Description
General	This section contains general information about the task instance.
Instance Name	Name of this task instance.
Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.
Invoked by	System-supplied; how the task instance was launched.  Options:  Trigger: (Trigger Name)     Instance was launched by the named trigger.  Workflow: (Workflow Name)     Instance was launched by the named workflow.  Manually Launched     Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.

Calendar	Calendar associated with the task instance.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)
Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.

Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.
End Time	System-supplied; Date and time the task instance completed.
Duration	System-supplied; amount of time the task instance took to run.
Email Details	This section contains assorted detailed information about the task instance.
Email Template	Name of an Email template defined in an Email Template Details. An Email template allows you to specify standard recipients and text for outgoing emails. Enter the name of an existing Email template, select an Email template from the drop-down list, or click the Details icon to create a new Email template.
	Every Email template specifies an Email connection. If you do not specify an Email template in this field, you must specify an Email connection in the Email Connection field.
	If you specify both an Email template (in this field) and an Email Connection, the Email server specified in the Email Connection field overrides the Email server specified in this field.
	(Any information specified in an Email task overrides what is specified in an Email template.)
Email Template Variable	Indication of whether the Email Template field is a reference field for selecting a specific Email Template (unchecked) or a text field for specifying the Email Template as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using a Email Template reference to using a Email Template variable, you must change the Email Template Variable field to Yes and specify the Email Template variable in the Email Template Unresolved field. Conversely, to change from using an Email Template variable to using an Email Template reference, you must change the Email Template Variable field to No and specify the Email Template reference in the Email Template field.  Template field.

Email Connection	Required if an Email Template is not specified in the Email Template field; Name of an outgoing Email Connection (Type = Outgoing). An Email Connection specifies information about an outgoing or incoming email server. Enter the name of an existing outgoing Email Connection, select an existing outgoing Email Connection from the drop-down list, or clear the Email Connection field and click the Details icon to create a new Email Connection (Outgoing will be pre-selected in the Type field).  If you specify both an Email Template and an Email Connection (in this field), the Email Connection specified in this field overrides the Email Connection specified in the Email Template field.
Reply-To	Email address of the sender. Use commas to separate multiple recipients. Variables and functions supported.
То	Email address of the recipient. Use commas to separate multiple recipients. Variables and functions supported.
CC	Email address of the party being sent a copy of the email, if any. Use commas to separate multiple recipients. Variables and functions supported.
ВСС	Email address of the party being sent a blind (hidden) copy of the email, if any. Use commas to separate multiple recipients. Variables and functions supported.
Subject	Subject line of the email. Variables and functions supported.
Body	Text of the email message. Variables and functions supported. If both the email template and the email task contain text in the body, the text is appended.
Report	Report attached to this email.
Report Variable	Indication of whether the Report field is a reference field for selecting a specific Report (unchecked) or a text field for specifying the Report as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Email Tasks, to change from using a report reference to using a report variable, you must change the Report Variable field to Yes and specify the report variable in the Report Unresolved field. Conversely, to change from using a report variable to a using a report reference, you must change the Report Variable field to No and specify the report reference in the Report field.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.

Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	• - None - • Time
	<ul><li>Relative Time</li><li>Duration</li></ul>
	• Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	• None
	<ul> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> </ul>
	<ul> <li>Same Day Do not advance day.</li> <li>Next Day</li> </ul>
	Advance to the next day.  Next Business Day
	Advance to the next business day.  • Sunday If today is not Sunday, advance to next Sunday.
	Monday     If today is not Monday, advance to next Monday.  If today is not Monday, advance to next Monday.
	Tuesday If today is not Tuesday, advance to next Tuesday.  Mednesday.
	<ul> <li>Wednesday</li> <li>If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday</li> </ul>
	If today is not Thursday, advance to next Thursday.  • Friday
	If today is not Friday, advance to next Friday.
	<ul> <li>Saturday         If today is not Saturday, advance to next Saturday.     </li> </ul>
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.

Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.  Options are:  - None -  Duration Seconds
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Time Options	This section contains time-related specifications for the task instance.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

### Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday, Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future. Default is - None --. Late Start Nth If Late Start Day Constraint = Nth Day; Number of days to advance. Amount Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early	
Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.
	Valid values:
	<ul> <li> None Advance to the next day if the specified early finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday</li> </ul>
	If today is not Tuesday, advance to next Tuesday.  • Wednesday If today is not Wednesday, advance to next Wednesday.  • Thursday If today is not Thursday, advance to next Thursday.  • Friday If today is not Friday, advance to next Friday.
	<ul> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul>
	Default is – None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.

### CP Duration (Resolved)

Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.

### CP Duration Unit

Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select **Minutes** in this field

### Options:

- Seconds
- Minutes
- Hours

#### Default is Minutes.

# Workflow Execution Options

This section contains Execution Restriction specifications for the task if it is within a Workflow.

## Execution Restriction

Specification for whether or not there is a restriction for this task to be run, skipped, or held.

### Options are:

- · -- None -- No restriction for this task.
- Run Restriction for when this task will be run.
- Skip Restriction for when this task will be skipped.
- Hold Restriction for when this task will be held.

If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

### Restriction Period

If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.

#### Options are:

- - None -
  - No period of restriction for this task.
- Before
  - Restriction is valid if the date is before the Before Date value.
- After
  - Restriction is valid if the date is after the After Date value.
- Span
- Restriction is valid if the date is before the Before Date value and after After Date value.
- On

Restriction is valid if the date is one of the Date List values.

Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instance.
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Status History	History of all statuses that the task instance has gone through.

Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.
Update	Saves updates to the record.
Force Finish	See Force Finishing a Task.
Hold	Places the task instance on Hold (see Putting a Task on Hold).
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.
Re-run	See Re-running a Task.
View Parent	Displays the task instance Details for the parent Workflow of this task instance.
Retrieve Output	See Retrieving Output.
Delete	Deletes the current record.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task instance.
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.
Virtual Resources	Lists all Virtual Resources to which this task is assigned.
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.
Notes	Lists all notes associated with this record.

## **Running an Email Task**

You can run an Email task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the Email Tasks list or Email Task Details Action menu.
  As part of a workflow.
  Specify triggers that run the task automatically based on times or events.

## **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

## **Task Monitor Task**

- Overview
- Built-In Variables
- Processing Flow for Task Monitors
  - Launching a Task Monitor Task Within a Workflow
  - Launching a Task Monitor Task Using a Task Monitor Trigger
  - Launching a Task Monitor Task Manually or Via Other Trigger
- Creating a Task Monitor Task
  - Task Monitor Task Details
  - Task Monitor Task Details Field Descriptions
- Viewing a Task Monitor Task Instance
  - Task Monitor Task Instance Details
  - Task Monitor Task Instance Details Field Descriptions
- Viewing Potential Matches for a Running Task Monitor Task Instance
- Monitoring Task Execution
- Understanding Relative Time Scope

## Overview

The Task Monitor task monitors another task or tasks for one or more specific statuses.

When setting up a Task Monitor task, you can monitor:

- All tasks
- Specific task
- Task type, such as a Windows task
- Group of tasks based on the name, such as all tasks whose name contains the string **DEV**

You also can monitor for any combination of task statuses.

For example, you can monitor for:

- All tasks with a status of RESOURCE WAIT or UNDELIVERABLE
- All Windows tasks in a FAILED status
- All tasks whose name contains **REPORT** that have a status of SUCCESS.

For Task Monitors within a workflow, you can also specify a Time Scope, or window of time, during which the event being monitored for must be satisfied.

## **Built-In Variables**

The following built-in variables can be used in a Task Monitor task to pass data where appropriate:

- Task Instance variables
- Task Monitor Task variables

## **Processing Flow for Task Monitors**

The processing on a Task Monitor may differ depending on which of the following methods was used to launch it:

- Launched by a workflow
- · Launched by a Task Monitor trigger
- · Launched manually or by another trigger

Each method is described in detail below.

#### Note

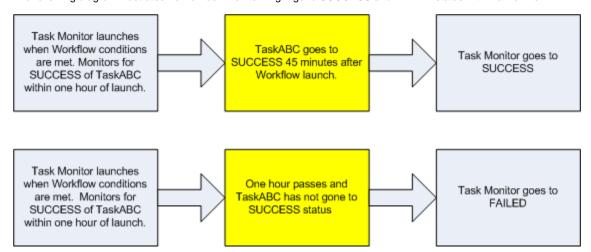

Any changes made to a Task Monitor task are not recognized by its respective Triggers until those Triggers are disabled and re-enabled.

## Launching a Task Monitor Task Within a Workflow

Within a Workflow, the Task Monitor task launches like any other task in the Workflow; that is, whenever the Workflow conditions warrant it. The Task Monitor runs until one of the conditions described below occurs:

- · When the conditions specified in the Task Monitor are met, the Task Monitor goes to a status of SUCCESS.
- When the time window specified in the Task Monitor passes and the conditions in the Task Monitor are not met, the Task Monitor goes to a status of FAILED. If the time window is entirely in the past and Universal Controller does not locate the required event in the Activity table when the Task Monitor launches, the Task Monitor goes immediately to a FAILED status.
- If no time window is specified in the Task Monitor and the Task Monitor conditions are not met, the Task Monitor task continues running.
- A user can manually force finish the Task Monitor task.

The following diagram illustrates how a Task Monitor might go to SUCCESS and FAILED status within a workflow.

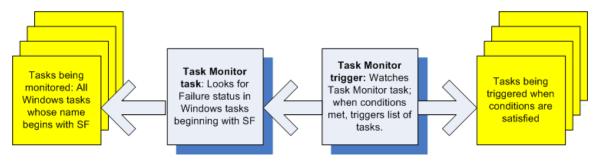

## Launching a Task Monitor Task Using a Task Monitor Trigger

The Task Monitor task launches when the user enables the Task Monitor trigger. Each time the conditions in the Task Monitor task are satisfied, the tasks specified in the trigger are launched. This

process continues until a user disables the associated Task Monitor trigger.

The following diagram shows an example of how you might set up a task monitoring scheme using the Task Monitor task and Task Monitor trigger.

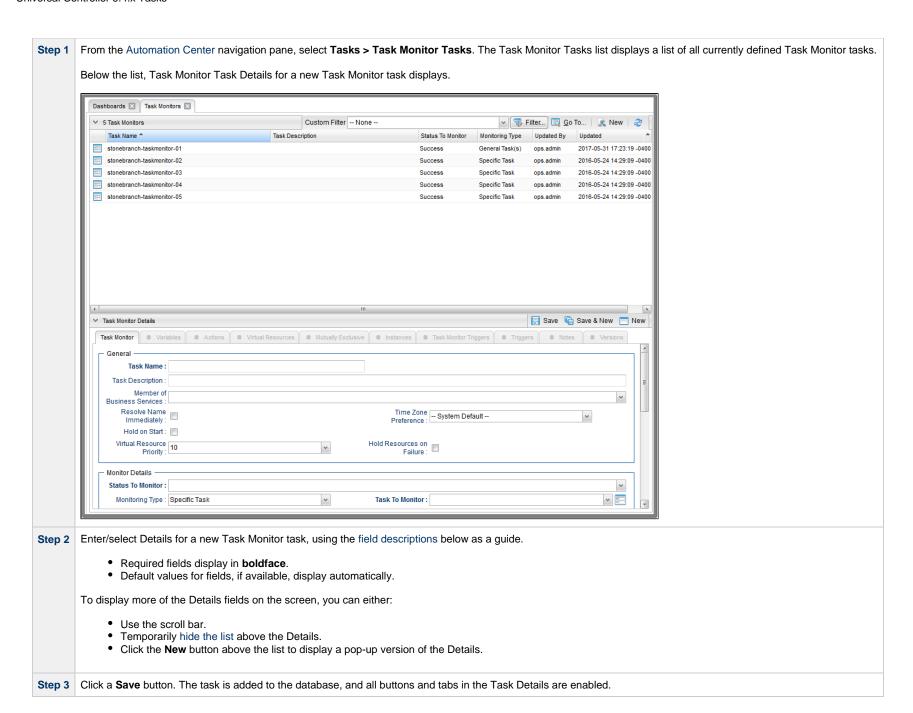

## Launching a Task Monitor Task Manually or Via Other Trigger

If you manually launch a Task Monitor task or launch it using a trigger other than a Task Monitor trigger, such as a Time trigger, the task continues running until its specified conditions are met. When that occurs, the Task Monitor goes to SUCCESS. No other processing occurs unless you have configured notifications with the task or set up some other task(s) to launch based on the status of this task.

The Task Monitor runs until one of the conditions described below occurs:

- When the time window specified in the Task Monitor passes and the conditions in the Task Monitor are not met, the Task Monitor goes to a status of FAILED. If the time window is entirely in the past and the Controller does not locate the required event in the Activity table when the Task Monitor launches, the Task Monitor goes immediately to a FAILED status.
- · If no time window is specified in the Task Monitor and the Task Monitor conditions are not met, the Task Monitor task continues running.

## **Creating a Task Monitor Task**

#### Note

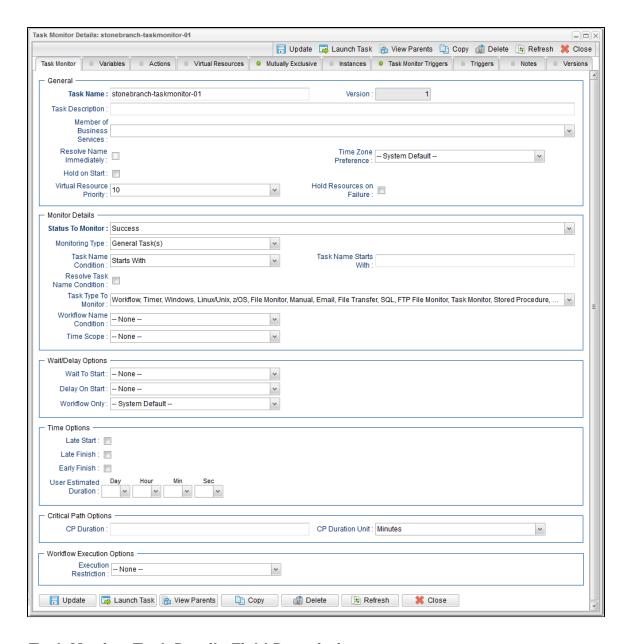

To open an existing record on the list, either:

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click **Open In Tab** in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

### **Task Monitor Task Details**

The following Task Monitor Task Details is for an existing Task Monitor task.

Depending on the values that you enter / select for these fields, and whether or not the Task Monitor task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the Task Monitor Task Details.

## **Task Monitor Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the Task Monitor Task Details.

Field Name	Description
General	This section contains general information about the task.
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.
	Options:
	<ul> <li>System Default –         Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxx)         Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.</li> <li>Inherited</li> </ul>
	Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.
Hold Reason	Information about why the task will be put on hold when it starts.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).
	Default is 10.

Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Task Monitor Details	This section contains assorted detailed information about the task.
Status To Monitor	Status being monitored for. When the task being monitored goes to a status specified in this field, the associated trigger is satisfied and the tasks specified in the trigger launch. You can specify status only, or status and exit code. You can specify as many statuses as needed (see Task Statuses).
Monitoring Type	Specifies which task or tasks are being monitored.  Options:
	<ul> <li>Specific Task - One task is being monitored. Use the Task to Monitor field to specify the task name.</li> <li>General Tasks - Allows you to specify selection parameters that determine which task or tasks to be monitored. Use the Task Name Condition and Task Type to Monitor fields to create your selection parameters.</li> </ul>
Task to Monitor	If Monitoring Type = Specific Task; specifies the task to monitor. Enter a task name or select a task from the drop-down list. To display details about a task on the list, select it and then click the Task To Monitor icon.
Task Name Condition	If Monitoring Type = General Task(s); specifies a type of condition for the name of tasks being monitored for. If you select a condition type, a corresponding field displays that allows you to enter a value for that condition. Only tasks meeting the specified condition value will be monitored for.
	Options:      None     Equals     Starts With     Contains     Ends With
Task Type to Monitor	If Monitoring Type = General Tasks; allows you to define specific task types to monitor for. For example, to monitor all SQL tasks, you would select Monitoring Type = General Tasks, then select Task Type to Monitor = SQL Tasks.
Task Name Starts With	If Task Name Condition = Starts With; Character string at the start of the name of a task or tasks being monitored for.
Task Name Contains	If Task Name Condition = Contains; Character string in the name of a task or tasks being monitored for.
Task Name Ends With	If Task Name Condition = Ends With; Character string at the end of the name of a task or tasks being monitored for.
Task Name Equals	If Task Name Condition = Equals; Character string equaling the name of a task or tasks being monitored for.

Resolve Task Name Condition	If Monitoring Type = Generals Task(s) and Task Name Condition = Starts With, Contains, Ends With, or Equals; Specification (true or false) for whether or not to resolve at run time any variables in the task name of the task(s) being monitored.  Default is false.
Workflow Name Condition	Type of condition for the name of a workflow or workflows containing the task being monitored for. If you select a condition type, a corresponding field displays that allows you to enter a value for that condition.
	Only tasks in workflows meeting the specified condition value will be monitored for.
	Options:
	<ul> <li> None</li> <li>Equals</li> <li>Starts With</li> <li>Contains</li> <li>Ends With</li> </ul>
Workflow Name Equals	Optional if Workflow Name Condition = Equals; Exact name of a workflow or workflows containing the task being monitored for. If the field is blank, the Task Monitor will consider a Task Instance for a match only if the Task Instance is not contained within a workflow.
Workflow Name Starts With	Required if Workflow Name Condition = Starts With; Character string at the start of the name of a workflow or workflows containing the task being monitored for.
Workflow Name Contains	Required if Workflow Name Condition = Contains; Character string in the name of a workflow or workflows containing the task being monitored for.
Workflow Name Ends With	Required if Workflow Name Condition = Ends With; Character string at the end of the name of a workflow or workflows containing the task being monitored for.
Time Scope	Used for Task Monitor tasks not associated with a trigger. The Time Scope fields are used to create a window during which the Task Monitor conditions must be met in order for the Task Monitor to be satisfied. The Time Scope window is always relative to the time that the Task Monitor launched. For example, if you put -01:00 in the From time field and 02:00 in the To time field, the window's begin time is one hour before the Task Monitor is launched and its end time is two hours after it is launched.
	Note For additional details, see Understanding Relative Time Scope, below.

From [+/-]hh:mm:	If Time Scope = Relative; used for Task Monitor tasks not associated with a trigger. Together with the Time Scope To field, it allows you to specify a window of time, relative to the time the Task Monitor task launched, during which the conditions of the Task Monitor must be met. If the conditions are not met within the specified window, the Task Monitor task goes to a FAILED status.  If you specify a past time in the this field, as soon as the Task Monitor task launches, the Controller searches the Activity table for past events that match the specified conditions. If the conditions are satisfied already, the Task Monitor task goes immediately to SUCCESS status. Otherwise, the Controller continues monitoring until the conditions are met or until the To time has passed.
To [+/-]hh:mm:	If Time Scope = Relative; used for Task Monitor tasks not associated with a trigger. Together with the Time Scope From field, it allows you to specify a window of time, relative to the time the Task Monitor task launched, during which the conditions of the Task Monitor must be met. If the conditions are not met within the specified window, the Task Monitor task goes to a FAILED status.  If the conditions in the Task Monitor task are met before the Time Scope To time arrives, the Task Monitor task goes to SUCCESS. If the conditions are not met by the Time Scope To time, the Task Monitor task goes to FAILED status.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.  Options are:  - None -  Time Relative Time Duration Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

### Wait Day Constraint If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day. Valid values: -- None --• If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. Same Dav Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Default is - None --. Wait Duration If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task. Wait **Duration In** If Wait To Start = Seconds; Number of seconds to wait before starting the task. Seconds Delay On Start Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified. Options are: None – Duration Seconds

Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  Options are:  System Default     Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.)  Yes     Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  No     Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for task instances of the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

### Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Same Dav Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future. Default is - None --. Late Start Nth Amount If Late Start Day Constraint = Nth Day; Number of days to advance. Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Late Finish Type	Required if Late Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:
	<ul> <li>None Advance to the next day if the specified late finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul> Default is - None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.
Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.

If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Required if Early Finish is enabled.
Options:
<ul> <li>Time - Flag the task if it finishes before the specified time (see Early Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.</li> </ul>
If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:
- None Advance to the next day if the specified early finish time is before the Created time of the task instance.  Same Day Do not advance day.  Next Day Advance to the next day.  Next Business Day Advance to the next business day.  Sunday If today is not Sunday, advance to next Sunday.  Monday If today is not Monday, advance to next Monday.  Tuesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Wednesday, advance to next Wednesday.  Thursday If today is not Wednesday, advance to next Thursday.  Thursday If today is not Friday, advance to next Thursday.  Friday If today is not Friday, advance to next Friday.  Saturday If today is not Saturday, advance to next Saturday.  Nth Day Advance to a specific number of days in the future.  Default is — None
If Early Finish Day Constraint = Nth Day; Number of days to advance.

Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds  Minutes  Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.

## Execution Restriction Specification for whether or not there is a restriction for this task to be run, skipped, or held. Options are: -- None -- No restriction for this task. • Run Restriction for when this task will be run. • Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held. If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow. Restriction Period If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted. Options are: • - None -No period of restriction for this task. Restriction is valid if the date is before the Before Date value. Restriction is valid if the date is after the After Date value. Restriction is valid if the date is before the Before Date value and after After Date value. On Restriction is valid if the date is one of the Date List values. Before Date If Restriction Period = Before or Span; Date before which the restriction is valid. Before If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid. Time After Date If Restriction Period = After or Span; Date after which the restriction is valid. After Time If Restriction Period = After or Span; Time on the selected date after which the restriction is valid. Date List If Restriction Period = On; Date(s) on which the restriction is valid. **Statistics** This section contains time-related statistics for task instances of the task.

System-supplied; date and time this task first ran.
System-supplied; date and time the task last ran.
System-supplied; amount of time the task took to run the last time it ran.
System-supplied; shortest amount of time this task has taken to run.
System-supplied; average amount of time this task takes to run.
System-supplied; longest amount of time this task has taken to run.
System-supplied; number of instances in the database for this task.
This section contains Metadata information about this record.
Universally Unique Identifier of this record.
y Name of the user that last updated this record.
Date and time that this record was last updated.
Name of the user that created this record.
Date and time that this record was created.
This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Saves a new task record in the Controller database.
Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Saves a new record in the Controller database and continues to display that record.
Displays empty (except for default values) Details for creating a new task.
Saves updates to the record.
, , , , ,

Launch Task	Manually launches the task.
View Parents	Displays a list of any parent Workflow tasks for this task.
Сору	Creates a copy of this task, which you are prompted to rename.
Delete	Deletes the current record.  Note You cannot delete a task if it is either:  Specified in an enabled Trigger.  The only task specified in a disabled Trigger.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task.
Tabs	This section identifies the tabs across the top of the Task Details that provide access to additional information about the task.
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.

# Actions

Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task.

Events are:

- Task instance status
- Exit codes
- Late start
- Late finish
- Early finish

#### Actions are:

Abort Action	Abort the task if certain events occur. For details, see Abort Actions.
Email Notification	Send an email if certain events occur. For details, see Email Notification Actions.
Set Variable	Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow.
SNMP Notification	Send an email if certain events occur. For details, see SNMP Notification Actions.
System Operation	Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions.

#### Virtual Resources

Lists all Virtual Resources to which this task is assigned.

#### Mutually Exclusive

Lists all tasks that have been set to be mutually exclusive of this task.

## Instances Task

Lists all instances of this task.

## Monitor Triggers

Lists all Task Monitor triggers that reference this task in the Task Monitor field of the trigger Details; that is, a list of all Task Monitor triggers that execute this task. For instructions on creating triggers, see Triggers.

#### Triggers

List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current task name>#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers.

#### Notes

Lists all notes associated with this record.

Versions	
	Stores copies of all previous versions of the current record. See Record Versioning.

## **Viewing a Task Monitor Task Instance**

When a Task Monitor task is launched, the Controller creates a task instance record of that task.

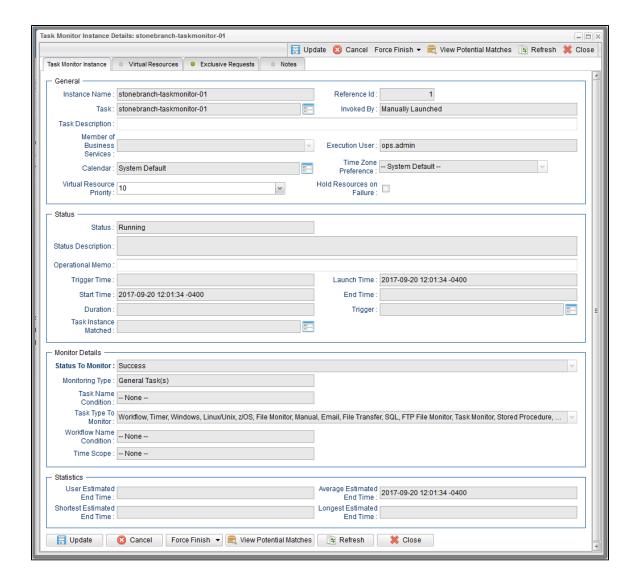

A task instance contains detailed information about a single execution of that task.

You can access a task instance from:

- Instances tab on the Task Monitor Task Details for that task
- Activity Monitor
- Task Instances list

#### **Task Monitor Task Instance Details**

The following Task Monitor Task Instance Details contains information on the execution of the task shown in the Task Monitor Task Details.

## **Task Monitor Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in Task Monitor Task Instance Details.

Field Name	Description
General	This section contains general information about the task instance.

Instance Name	Name of this task instance.
Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.
Invoked by	System-supplied; how the task instance was launched.  Options:  Trigger: (Trigger Name) Instance was launched by the named trigger.  Workflow: (Workflow Name) Instance was launched by the named workflow.  Manually Launched Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.

Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)
Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.

End Time	System-supplied; Date and time the task instance completed.
Duration	System-supplied; amount of time the task instance took to run.
Trigger	Trigger, if any, on whose behalf the Task Monitor task is monitoring other tasks.
Task Instance Matched	Last task that matched the specifications of the task(s) being monitored.
Task Monitor Details	This section contains assorted detailed information about the task instance.
Status To Monitor	Status being monitored for. When the task being monitored goes to a status specified in this field, the associated trigger is satisfied and the tasks specified in the trigger launch. You can specify status only, or status and exit code. You can specify as many statuses as needed (see Task Statuses).
Monitoring Type	Specifies which task or tasks are being monitored.  Options:
	<ul> <li>Specific Task - One task is being monitored. Use the Task to Monitor field to specify the task name.</li> <li>General Tasks - Allows you to specify selection parameters that determine which task or tasks to be monitored. Use the Task Name Condition and Task Type to Monitor fields to create your selection parameters.</li> </ul>
Task to Monitor	If Monitoring Type = Specific Task; specifies the task to monitor. Enter a task name or select a task from the drop-down list. To display details about a task on the list, select it and then click the Task To Monitor icon.
Task Name Condition	If Monitoring Type = General Task(s); specifies a type of condition for the name of tasks being monitored for. If you select a condition type, a corresponding field displays that allows you to enter a value for that condition. Only tasks meeting the specified condition value will be monitored for.  Options:  None Equals - Starts With - Contains - Ends With
Task Name Starts With	If Task Name Condition = Starts With; character string at the start of the name of a task or tasks being monitored for.
Task Name Contains	If Task Name Condition = Contains; character string in the name of a task or tasks being monitored for.

A Name Condition = Equals; Character string equaling the name of a task or tasks being monitored for.  If you select a condition type, a corresponding field displays that allows you to a value for that condition.  asks in workflows meeting the specified condition value will be monitored for.  Is:  None Equals Starts With Contains Ends With  If you select a condition type, a corresponding field displays that allows you to a value for that condition.  If you select a condition type, a corresponding field displays that allows you to a value for that condition.  If you select a condition type, a corresponding field displays that allows you to a value for that condition.  If you select a condition type, a corresponding field displays that allows you to a value for that condition type, a corresponding field displays that allows you to a value for that condition type, a corresponding field displays that allows you to a value for that condition type, a corresponding field displays that allows you to a value for that condition type, a corresponding field displays that allows you to a value for that condition type, a corresponding field displays that allows you to a value for that condition type, a corresponding field displays that allows you to a value for that condition type, a corresponding field displays that allows you to a value for that condition type, a corresponding field displays that allows you to a value for that condition type, a corresponding field displays that allows you to a value for that condition type, a corresponding field displays that allows you to a value for that condition type, a corresponding field displays that allows you to a value for that condition type, a corresponding field displays that allows you to a value for that condition type, a corresponding field that allows you to a value for that condition type, a corresponding field that allows you to a value field that condition type, a corresponding field that allows you to a value field that condition type, a corresponding field tha
a value for that condition.  asks in workflows meeting the specified condition value will be monitored for.  ass:  None  Equals  Starts With  Contains  Ends With  Mal if Workflow Name Condition = Equals; Exact name of a workflow or workflows containing the task being monitored for. If the field is blank, the Task Monitor will consider a
nal if Workflow Name Condition = Equals; Exact name of a workflow or workflows containing the task being monitored for. If the field is blank, the Task Monitor will consider a
red if Workflow Name Condition = Starts With; Character string at the start of the name of a workflow or workflows containing the task being monitored for.
ted if Workhow Name Condition = Starts with, Character string at the start of the name of a workhow of workhows Containing the task being monitored for.
red if Workflow Name Condition = Contains; Character string in the name of a workflow or workflows containing the task being monitored for.
red if Workflow Name Condition = Ends With; Character string at the end of the name of a workflow or workflows containing the task being monitored for.
for Task Monitor tasks not associated with a trigger. The Time Scope fields are used to create a window during which the Task Monitor conditions must be met in order for the Monitor to be satisfied. The Time Scope window is always relative to the time that the Task Monitor launched. For example, if you put -01:00 in the From time field and 02:00 in time field, the window's begin time is one hour before the Task Monitor is launched and its end time is two hours after it is launched.
N

From [+/-]hh:mm:	If Time Scope = Relative; used for Task Monitor tasks not associated with a trigger. Together with the Time Scope To field, it allows you to specify a window of time, relative to the time the Task Monitor task launched, during which the conditions of the Task Monitor must be met. If the conditions are not met within the specified window, the Task Monitor task goes to a FAILED status.  If you specify a past time in the this field, as soon as the Task Monitor task launches, the Controller searches the Activity table for past events that match the specified conditions. If the conditions are satisfied already, the Task Monitor task goes immediately to SUCCESS status. Otherwise, the Controller continues monitoring until the conditions are met or until the To time has passed.
To [+/-]hh:mm:	If Time Scope = Relative; used for Task Monitor tasks not associated with a trigger. Together with the Time Scope From field, it allows you to specify a window of time, relative to the time the Task Monitor task launched, during which the conditions of the Task Monitor must be met. If the conditions are not met within the specified window, the Task Monitor task goes to a FAILED status.  If the conditions in the Task Monitor task are met before the Time Scope To time arrives, the Task Monitor task goes to SUCCESS. If the conditions are not met by the Time Scope To time, the Task Monitor task goes to FAILED status.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.  Options are:  - None - Time Relative Time Duration Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

#### Wait Day Constraint If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day. Valid values: -- None --• If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. Same Day Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Default is - None --. Wait If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task. Duration Wait **Duration In** If Wait To Start = Seconds; Number of seconds to wait before starting the task. Seconds Delay On Start Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified. Options are: None – Duration Seconds

Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Time Options	This section contains time-related specifications for the task instance.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.

#### Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday, Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future. Default is - None --. Late Start Nth If Late Start Day Constraint = Nth Day; Number of days to advance. Amount Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None     Advance to the next day if the specified late finish time is before the Created time of the task instance.  • Same Day     Do not advance day.  • Next Day     Advance to the next day.  • Next Business Day     Advance to the next business day.  • Sunday     If today is not Sunday, advance to next Sunday.  • Monday     If today is not Monday, advance to next Monday.  • Tuesday     If today is not Tuesday, advance to next Tuesday.  • Wednesday     If today is not the Mednesday, advance to next Wednesday.  • Thursday     If today is not Thursday, advance to next Thursday.  • Friday     If today is not Friday, advance to next Thursday.  • Friday     If today is not Friday, advance to next Saturday.  • It today is not Saturday, advance to next Saturday.  • It today is not Saturday, advance to next Saturday.  • It today is not Saturday, advance to next Saturday.  • Nith Day     Advance to a specific number of days in the future.  Default is None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early Finish Day	
Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:
	<ul> <li> None Advance to the next day if the specified early finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> </ul>
	<ul> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul> Default is – None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Critical Path Options	This section contains Critical Path-related specifications for the task.
1	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.

#### CP Duration (Resolved)

Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.

#### CP Duration Unit

Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select **Minutes** in this field

#### Options:

- Seconds
- Minutes
- Hours

#### Default is Minutes.

# Workflow Execution Options

This section contains Execution Restriction specifications for the task if it is within a Workflow.

## Execution Restriction

Specification for whether or not there is a restriction for this task to be run, skipped, or held.

#### Options are:

- -- None -- No restriction for this task.
- Run Restriction for when this task will be run.
- Skip Restriction for when this task will be skipped.
- Hold Restriction for when this task will be held.

If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

#### Restriction Period

If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.

#### Options are:

- - None -
- No period of restriction for this task.
- Before
  - Restriction is valid if the date is before the Before Date value.
- After
  - Restriction is valid if the date is after the After Date value.
- Span
- Restriction is valid if the date is before the Before Date value and after After Date value.
- On

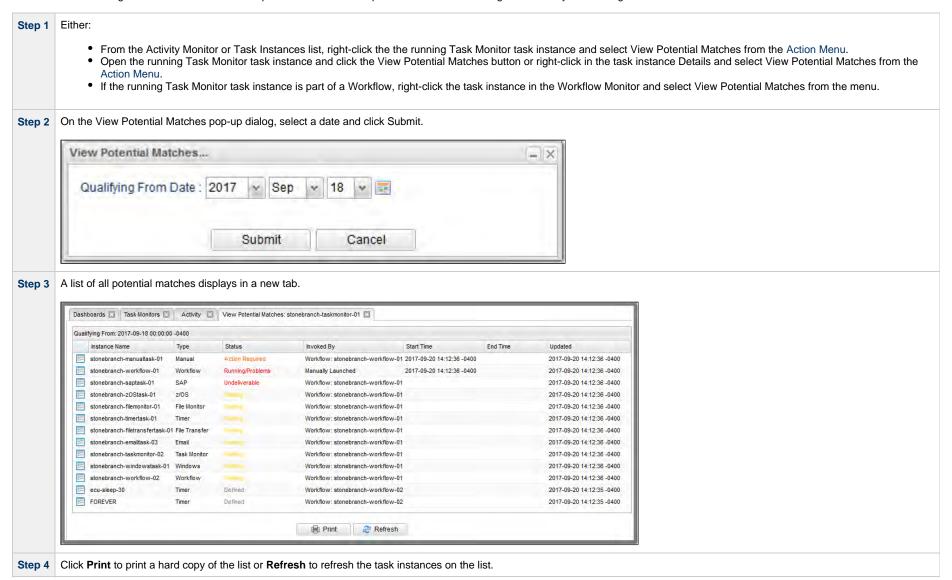

Restriction is valid if the date is one of the Date List values.

Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instance.
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Status History	History of all statuses that the task instance has gone through.

Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.
Update	Saves updates to the record.
Force Finish	See Force Finishing a Task.
Hold	Places the task instance on Hold (see Putting a Task on Hold).
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.
Re-run	See Re-running a Task.
View Parent	Displays the task instance Details for the parent Workflow of this task instance.
Delete	Deletes the current record.
View Potential Matches	For Task Monitor task instances in Running status; Allows you to view a list of running task instances that have the potential to match the specifications for tasks being monitored by the running Task Monitor instance (see Viewing Potential Matches for a Running Task Monitor Task Instance, below).
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task instance.
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.
Virtual Resources	Lists all Virtual Resources to which this task is assigned.
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.
Notes	Lists all notes associated with this record.

# **Viewing Potential Matches for a Running Task Monitor Task Instance**

To view a list of running task instances that have the potential to match the specifications for tasks being monitored by the running Task Monitor task instance:

## **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

#### **Understanding Relative Time Scope**

For any relative Time Scope conditions within the past, a Task Monitor will analyze only the current content of the database; specifically, by using the Status (ops\_exec."status\_code") and the State Changed Time (ops\_exec."state\_changed\_time") to determine potential matches from the time window in the past.

Consider a Task Monitor instance monitoring for a Failed status within a time window in the past. If a potential task instance has a current status of Failed, the current State Changed Time will indicate when that task instance transitioned to the Failed status. When the Task Monitor instance runs, any task instance with a matching Status, and a State Changed Time within the time window in the past, can be considered for a match.

#### Note

The Task Monitor instance will consider only the *current* content (that is, *current* Status and *current* State Changed Time) of the All Task Instances (ops\_exec) table when searching for qualifying task instances that *match within a time window in the past*.

Revisiting the example above, if you had a task instance with a status of Failed within the time window in the past, but prior to the Task Monitor instance running, the task instance was Finished, it would no longer be considered for a match.

Be aware that when specified, the Time Scope is relative to the time that the Task Monitor instance runs.

For example, consider the following Task Monitor instance:

Field	Value
Start Time	2017-11-02 15:05:00 -0400
From [+/-]hh:mm	-6:00
To [+/-]hh:mm	-2:00
Status To Monitor	Success
Task To Monitor	Sleep 0

For the relative Time Scope specified above, with a time window in the past, this would translate into the following query, paying particular attention to how the relative times are computed.

SELECT \* FROM ops\_exec WHERE "state\_changed\_time" >= '2017-11-02 09:05:00 -0400' AND "state\_changed\_time" <= '2017-11-02 13:05:00 -0400' AND "

#### Note

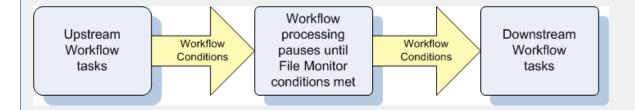

Any changes made to a File Monitor task are not recognized by its respective Triggers until those Triggers are disabled and re-enabled.

#### Launching a File Monitor Task Within a Workflow

The File Monitor task can be launched within a Workflow.

In this scenario, the task launches when the upstream workflow conditions are satisfied. Workflow processing then pauses until the conditions in the File Monitor task are satisfied. If the File Monitor is watching for the creation, change, or deletion of a file, the task goes to SUCCESS when the event occurs. If the File Monitor is watching for the existence or non-existence of a file, the task immediately goes to SUCCESS or FAILURE. Subsequent processing depends on the conditions built into the Workflow.

The following diagram illustrates the processing for this scenario.

#### Launching a File Monitor Task Using a File Monitor Trigger

A common use for the File Monitor task is to launch it using a File Monitor trigger, which specifies one or more tasks that are launched when a condition(s) is satisfied.

In this scenario, the File Monitor task launches when its associated File Monitor trigger is enabled.

You should use a File Monitor trigger to launch only File Monitor tasks that specify a single Agent, not an Agent Cluster. A File Monitor trigger can launch only a single task, not multiple tasks, which would be the case if an Agent Cluster was specified.

This method is best geared toward watching for the creation, deletion, or change in files. When the conditions in the File Monitor task are satisfied, the File Monitor task goes to SUCCESS and the tasks listed in the associated trigger are launched. The File Monitor task continues running until its conditions are satisfied or until the user disables the trigger.

If you use this method to check for the existence or non-existence of a file, as soon as the task is launched it goes to SUCCESS or FINISHED status. If it goes to SUCCESS, the tasks specified in the trigger are launched. A FINISHED status indicates that it found a file that shouldn't be there or didn't find a file that should be there. Both of these cases constitute a "failure" of the conditions and therefore the tasks in the trigger are not launched.

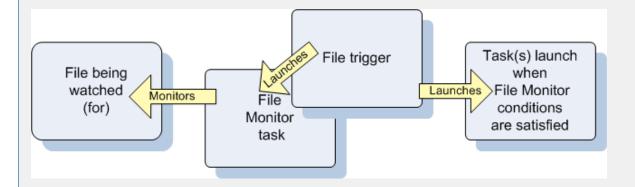

When the File Monitor task goes to FINISHED or SUCCESS, the associated File (Monitor) trigger is automatically disabled.

Using a File Monitor trigger to trigger a File Monitor task that is monitoring for the creation of one or more files ( Monitor Type = Exists) will disable the trigger. You should instead specify (Monitor Type = Create) and check Trigger on Existence.

When you launch a File Monitor task from a File trigger, you cannot manually cancel or force finish the task. You can only stop the task by disabling the trigger. If you manually disable the trigger while the task is still running, the task goes to FINISHED status.

The diagram below illustrates the processing flow for this scenario.

#### Launching a File Monitor Task Manually or Via Other Trigger

If you manually launch a File Monitor task or launch it using a non-File Monitor trigger, such as a Time trigger, the task continues running until its specified conditions are met, at which time the task goes to SUCCESS. No other processing occurs unless you have configured notifications with the task or set up some other task(s) to launch based on the status of this task.

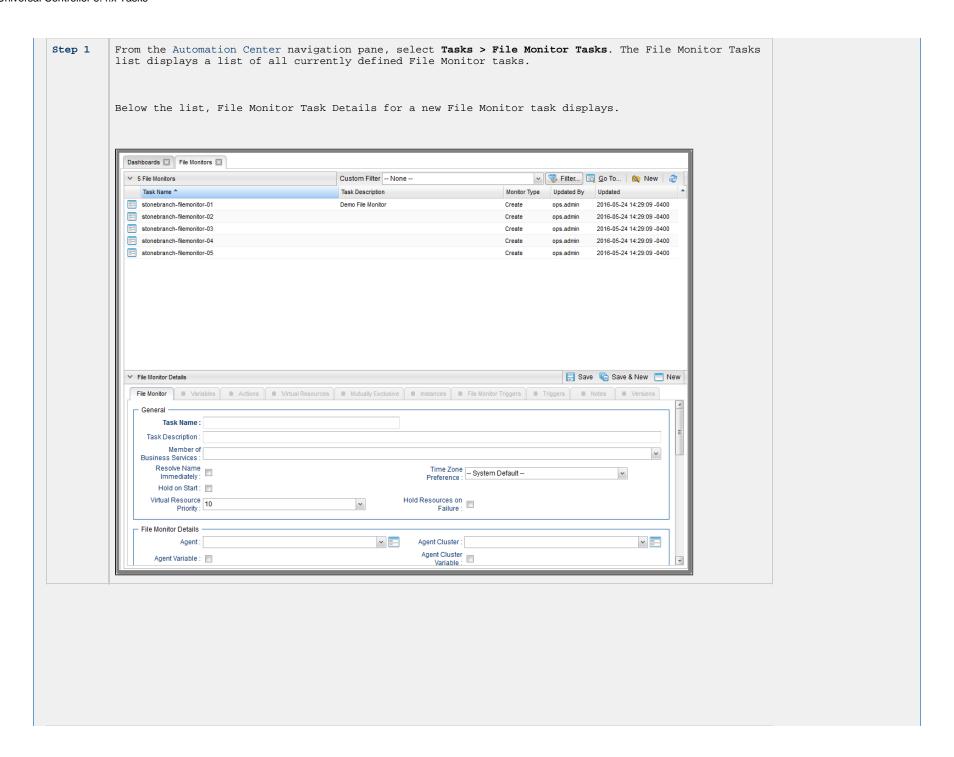

If the conditions are not met, the task runs perpetually or until a user issues a Cancel or Force Finish command against it.

#### Built-In Variables

The following built-in variables can be used in a File Monitor task to pass data where appropriate:

- Task Instance variables
- Agent-Based Task Instance variables
- File Monitor Task variables

Creating a File Monitor Task

Step 2

Enter/select Details for a new File Monitor task, using the field descriptions below as a guide.

- Required fields display in **boldface**.
- Default values for fields, if available, display automatically.

To display more of the Details fields on the screen, you can either:

- Use the scroll bar.
- ${}^{\bullet}$  Temporarily hide the list above the Details.
- Click the New button above the list to display a pop-up version of the Details.

Step 3

Click a **Save** button. The task is added to the database, and all buttons and tabs in the Task Details are enabled.

To open an existing record on the list, either:

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click Open in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click Open In Tab in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

#### File Monitor Task Details

The following File Monitor Task Details is for an existing File Monitor task.

Depending on the values that you enter / select for these fields, and whether or not the File Monitor task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the File Monitor Task Details.

## File Monitor Task Details Field Descriptions

The following table describes the fields, buttons, and tabs that display in the File Monitor Task Details.

Field Name	Description
General	This section contains general information about the task.
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)

Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.
	Options:
	• - System Default -  Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.
	• Server (xxx)  Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.
	• Inherited  Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.
Hold Reason	Information about why the task will be put on hold when it starts.

Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.
	Options: 1 (high) - 20 (low).
	Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resource will be returned only if the task instance status is either Complete, Finished, or Skipped.
File Monitor Details	This section contains assorted detailed information about the task.
Agent	Name of the Agent resource that identifies the machine where the operation will run. If you do not specify an Agent, you must specify an Agent Cluster.

#### Agent Variable

Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### ▲

#### Note

When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the **Agent Variable** field to **Yes** and specify the Agent variable in the **Agent Unresolved** field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the **Agent Variable** field to **No** and specify the Agent reference in the **Agent** field.

#### Agent Cluster

Group of Agents, one of which the Controller will choose to run this task (compare with Cluster Broadcast). You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.

# Agent Cluster Variable

Indication of whether the Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using an Agent Cluster reference to using an Agent Cluster variable, you must change the Agent Cluster Variable field to Yes and specify the Agent Cluster variable in the Agent Cluster Unresolved field. Conversely, to change from using an Agent Cluster variable to using an Agent Cluster reference, you must change the Agent Cluster Variable field to No and specify the Agent Cluster reference in the Agent Cluster field.

# Cluster Broadcast

Group of Agents, all of which will run this task (compare with Agent Cluster). You can specify a Cluster Broadcast in place of a specific Agent and/or agent cluster. Each instance of the task running on its own Agent becomes a separate task instance record in the database and displays separately on the Activity Monitor.

# Credentials

Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.

Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

### Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials Variable** field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

#### Monitor Type

Type of file event being monitored for.

Options:

- Create Wait for the creation of one or more files.
- Delete Wait for the deletion of one or more files.
- Change Monitor for a change in one or more files. [NOTE: not supported for z/OS.]
- $\bullet$  Exists Check to see if one or more files already exist.
- Missing Check to see if one or more files do not exist.

If Monitor Type = Create; task is triggered if the file being monitored for creation already exists.			
Location and name of a specific file or file pattern (for example, ACT001*) being monitored. Variables supported. Wildcards supported.			
Enables the use of a regular expression in the Monitor File(s) field.			
If enabled, the monitor searches the specified directory and all subdirectories.			
If Monitor Type = Create, Delete, or Change; For searches that use wildcards, limits the number of files to be searched.			
If Monitor Type = Create, Delete, Change, or Exists; User name / group name of the owner of the file on the operating system; that is, the user name / group name returned by the operating system in the file ownership information. LDAP groups are supported. Specifying a file owner limits the search to files with that owner.			
If Monitor Type = Change or Create: Period of time, in seconds, during which the file has not changed (File Monitor checks the modification timestamp and the file size).			
If Monitor Type = Change, the amount that the file size has changed, expressed as a percentage of the original file size. For example, enter 10 to monitor for a change in file size of 10 percent (larger or smaller).			

By Size (+/-)	If Monitor Type = Change, used in conjunction with the By Scale field, specifies an actual change in file size. For example, to monitor for a change in file size of 10 MB, enter 10 in this field and select MB in the By Scale field.
By Scale	If Monitor Type = Change, used in conjunction with the By Size field, specifies Bytes, KB (kilobytes), or MB (megabytes). For example, to monitor for a change in file size of 10MB, enter 10 in the By Size field and select MB in this field.
To Size	If Monitor Type = Change, used in conjunction with the To Scale field, specifies an actual file size that you want to monitor for. For example, to monitor for a file size of 5KB, enter 5 in this field and select KB in the To scale field
To Scale	If Monitor Type = Change, used in conjunction with the To Size field, specifies an actual file size that you want to monitor for. For example, to monitor for a file size of 5KB, enter 5 in the To Size field and select KB in this field.
Scan Text	If Monitor Type = Change or Exists, or if Monitor Type = Create and a value for Stable (seconds) is specified; string that the monitor will search for in the file or files. Specifying a string means that only files containing the string constitute a match. The Controller will process this field as a regular expression.
	The result (string is found or not found) is set in the Trigger File Scan Result built-in variable.
Scan Forward	If Monitor Type = Change; if enabled, this field specifies that once the File Monitor has been satisfied, it should continue from where it left off. If it is scanning within a file, it should resume from the point in the file that it last scanned. If it is monitoring for files, it should resume monitoring for the next file.
	If you are scanning a file that is being overwritten each time and you want to start from the beginning each time, you should disable Scan Forward.

Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.			
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.			
	Options are:			
	• - None -			
	• Time • Relative Time			
	• Duration • Seconds			
	• Seconds			
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.			

Wait Day Constraint If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day. Valid values: • -- None --• If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. • Same Day Do not advance day. • Next Day Advance to the next day. • Next Business Day Advance to the next business day. • Sunday If today is not Sunday, advance to next Sunday. • Monday If today is not Monday, advance to next Monday. • Tuesday If today is not Tuesday, advance to next Tuesday. • Wednesday If today is not Wednesday, advance to next Wednesday. • Thursday If today is not Thursday, advance to next Thursday. • Friday If today is not Friday, advance to next Friday. • Saturday If today is not Saturday, advance to next Saturday. Default is - None --.

Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.
Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.
	Options are:
	• - None -
	• Duration
	• Seconds
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.

# Workflow Only

Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.

Options are:

• - - System Default - -

Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is **yes**.)

• Yes

Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.

No

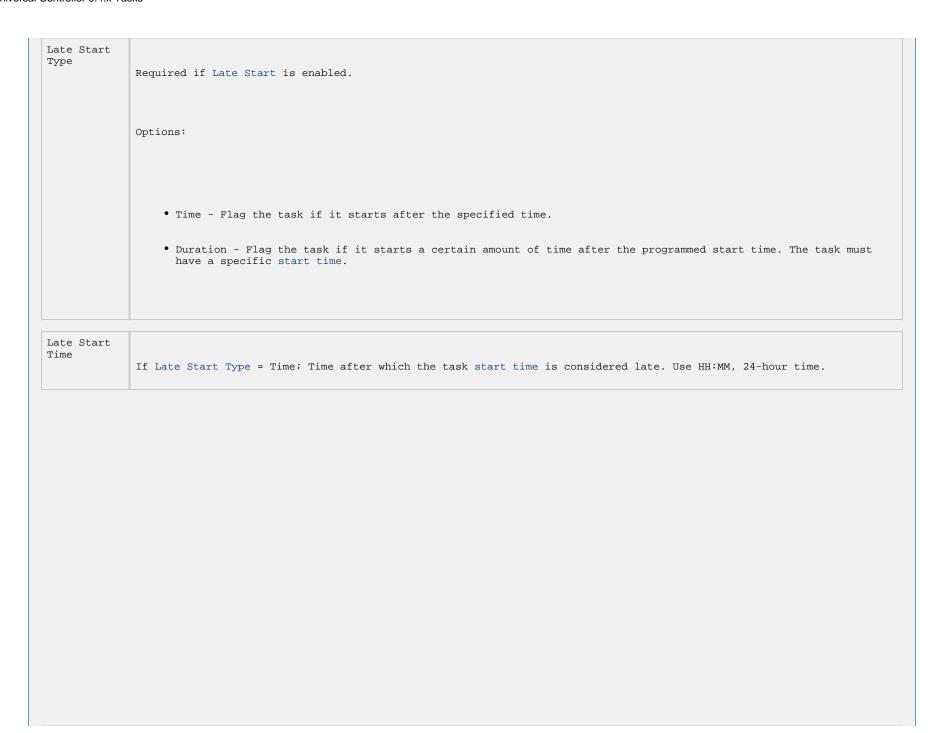

Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.

## Time Options

This section contains time-related statistics for task instances of the task.

#### Late Start

If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.

```
Late Start
Day
Constraint
             If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
             Valid values:
                  • -- None --
                   Advance to the next day if the specified late start time is before the Created time of the task instance.
                  • Same Day
                   Do not advance day.
                  • Next Day
                   Advance to the next day.
                  • Next Business Day
                   Advance to the next business day.
                  • Sunday
                   If today is not Sunday, advance to next Sunday.
                  • Monday
                   If today is not Monday, advance to next Monday.
                  • Tuesday
                   If today is not Tuesday, advance to next Tuesday.
                  • Wednesday
                   If today is not Wednesday, advance to next Wednesday.
                  • Thursday
                   If today is not Thursday, advance to next Thursday.
                   If today is not Friday, advance to next Friday.
                  • Saturday
                   If today is not Saturday, advance to next Saturday.
                   Advance to a specific number of days in the future.
             Default is - None --.
```

Late Start Nth Amount

If Late Start Day Constraint = Nth Day; Number of days to advance.

Late Start Duration

If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.

For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.

For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.

Late Finish

If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

# Late Finish Type

Required if Late Finish is enabled.

Options:

- Time Flag the task if it finishes after the specified time (see Late Finish Time).
- Duration Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.

## Late Finish Time

If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.

```
Late Finish
Day
Constraint
             If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.
             Valid values:
                  • -- None --
                   Advance to the next day if the specified late finish time is before the Created time of the task instance.
                  • Same Day
                   Do not advance day.
                  • Next Day
                   Advance to the next day.
                  • Next Business Day
                   Advance to the next business day.
                  • Sunday
                   If today is not Sunday, advance to next Sunday.
                  • Monday
                   If today is not Monday, advance to next Monday.
                  • Tuesday
                   If today is not Tuesday, advance to next Tuesday.
                  • Wednesday
                   If today is not Wednesday, advance to next Wednesday.
                  • Thursday
                   If today is not Thursday, advance to next Thursday.
                   If today is not Friday, advance to next Friday.
                  • Saturday
                   If today is not Saturday, advance to next Saturday.
                   Advance to a specific number of days in the future.
             Default is - None --.
```

Late Finish Nth Amount

If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration

If Late Finish Type = Duration; Longest amount of time this task instance should take to run.

Early Finish

If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.

Early Finish Type

Required if Early Finish is enabled.

Options:

- Time Flag the task if it finishes before the specified time (see Early Finish Time).
- Duration Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.

Early Finish Time

If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

```
Early Finish
Day
Constraint
             If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.
             Valid values:
                  • -- None --
                   Advance to the next day if the specified early finish time is before the Created time of the task instance.
                  • Same Day
                   Do not advance day.
                  • Next Day
                   Advance to the next day.
                  • Next Business Day
                   Advance to the next business day.
                  • Sunday
                   If today is not Sunday, advance to next Sunday.
                  • Monday
                   If today is not Monday, advance to next Monday.
                  • Tuesday
                   If today is not Tuesday, advance to next Tuesday.
                  • Wednesday
                   If today is not Wednesday, advance to next Wednesday.
                  • Thursday
                   If today is not Thursday, advance to next Thursday.
                   If today is not Friday, advance to next Friday.
                  • Saturday
                   If today is not Saturday, advance to next Saturday.
                   Advance to a specific number of days in the future.
             Default is - None --.
```

chortest amount of time this task instance should take to run.  I normally take to run this task. The Controller uses this information to calculate ask instance record.  h-related specifications for the task.			
ask instance record.			
h-related specifications for the task.			
This section contains Critical Path-related specifications for the task.			
Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer e to or greater than 0. Variables and Functions are supported.			
te of the CP Duration field, which may contain variables or functions that will be task instance starts. The CP Duration (Resolved) field can continue to change value which time CP Duration will display as resolved and CP Duration (Resolved) will not an issue resolving the variables and/or functions contained within CP Duration. If the CP Duration or it resolves to an invalid value, CP Duration will be ignored and the cal Path Duration based on historical executions.			
t			

# CP Duration Unit

Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select **Minutes** in this field.

Options:

- Seconds
- Minutes
- Hours

Default is Minutes.

# Workflow Execution Options

This section contains Execution Restriction specifications for the task if it is within a Workflow.

# Execution Restriction

Specification for whether or not there is a restriction for this task to be run, skipped, or held.

Options are:

- -- None --
- No restriction for this task.
- Run

Restriction for when this task will be run.

- Skir
- Restriction for when this task will be skipped.
- Hold

Restriction for when this task will be held.

If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

# Restriction Period If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted. Options are: • - None -No period of restriction for this task. • Before Restriction is valid if the date is before the Before Date value. • After Restriction is valid if the date is after the After Date value. • Span Restriction is valid if the date is before the Before Date value and after After Date value. • On Restriction is valid if the date is one of the Date List values. Before Date If Restriction Period = Before or Span; Date before which the restriction is valid. Before Time If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.

After Date			
	If Restriction Period = After or Span; Date after which the restriction is valid.		
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.		
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.		
Statistics	This section contains time-related statistics for task instances of the task.		
First Time Ran	System-supplied; date and time this task first ran.		
Last Time Ran	System-supplied; date and time the task last ran.		
Last Instance Duration			
Lowest Instance Time	System-supplied; shortest amount of time this task has taken to run.		
Average Instance Time	System-supplied; average amount of time this task takes to run.		
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.		

Number of Instances	System-supplied; number of instances in the database for this task.			
Metadata	This section contains Metadata information about this record.			
UUID	Universally Unique Identifier of this record.			
Updated By	Name of the user that last updated this record.			
Updated	Date and time that this record was last updated.			
Created By	Name of the user that created this record.			
Created	Date and time that this record was created.			
Buttons	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.			
Save	Saves a new task record in the Controller database.			
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.			
Save & View	Saves a new record in the Controller database and continues to display that record.			
New	Displays empty (except for default values) Details for creating a new task.			
Update	Saves updates to the record.			
Launch Task	k Manually launches the task.			
View Parents	Displays a list of any parent Workflow tasks for this task.			

Сору Creates a copy of this task, which you are prompted to rename. Delete Deletes the current record. Note You cannot delete a task if it is either: • Specified in an enabled Trigger. • The only task specified in a disabled Trigger. Refresh Refreshes any dynamic data displayed in the Details. Close For pop-up view only; closes the pop-up view of this task. Tabs This section identifies the tabs across the top of the Task Details that provide access to additional information about the task. Variables Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record. Actions Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task. Events are:

	• Task instance	status
	• Exit codes	
	• Late start	
	• Late finish	
	• Early finish	
	Actions are:	
	Abort Action	Abort the task if certain events occur. For details, see Abort Actions.
	Email Notification	Send an email if certain events occur. For details, see Email Notification Actions.
	Set Variable	Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow.
	SNMP Notification	Send an email if certain events occur. For details, see SNMP Notification Actions.
	System Operation	Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions.
Virtual Resources	Lists all Virtual Re	esources to which this task is assigned.
	Lists all Virtual Re	esources to which this task is assigned.

Mutually Exclusive	Lists all tasks that have been set to be mutually exclusive of this task.				
Instances	Lists all instances of this task.				
File Monitor Triggers	Lists all File Monitor triggers that reference this task in the File Monitor field of the trigger Details; that is list of all File Monitor triggers that execute this task. For instructions on creating triggers, see Triggers.				
Triggers	List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current name="" task="">#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers.</current>				
Notes	Lists all notes associated with this record.				
Versions	Stores copies of all previous versions of the current record. See Record Versioning.				

# Viewing a File Monitor Task Instance

When a File Monitor task is launched, the Controller creates a task instance record of that task.

A task instance contains detailed information about a single execution of that task.
You can access a task instance from:
• Instances tab on the File Monitor Task Details for that task
• Activity Monitor
• Task Instances list
File Monitor Task Instance Details
The following File Monitor Task Instance Details contains information on the execution of the task shown in the File Monitor Task Details.

# File Monitor Task Instance Details Field Descriptions

The following table describes the fields, buttons, and tabs that display in File Monitor Task Instance Details.

Field Name	Description			
General	This section contains general information about the task instance.			
Instance Name	Name of this task instance.			
Reference Id	System-supplied; the Controller increments this number each time the task is run.			
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.			

Invoked by	
	System-supplied; how the task instance was launched.
	Options:
	• Trigger: (Trigger Name)  Instance was launched by the named trigger.
	Workflow: (Workflow Name)  Instance was launched by the named workflow.  Manually Launched
	Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.

# Time Zone Preference

User-defined; allows you to specify the time zone that will be applied to the task.

Options:

• - System Default -

Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.

• Server (xxx)

Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.

• Inherited

Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.

# Virtual Resource Priority

Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.

Options: 1 (high) - 20 (low).

Default is 10.

# Hold Resources on Failure

If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.

Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)
Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.

Launch Time	System-supplied; Date and time the task instance was launched.
	System-supplied, Date and time the task instance was faunched.
Start Time	
	System-supplied; Date and time the task instance started.
End Time	
	System-supplied; Date and time the task instance completed.
Duration	
	System-supplied; amount of time the task instance took to run.
File Monitor	This section contains assorted detailed information about the task instance.
Details	
Agent	
	Name of the Agent resource that identifies the machine where the operation will run. If you do not specify an Agent, you must specify an Agent Cluster.

# Agent Variable

Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

# ▲

#### Note

When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the **Agent Variable** field to **Yes** and specify the Agent variable in the **Agent Unresolved** field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the **Agent Variable** field to **No** and specify the Agent reference in the **Agent** field.

### Agent Cluster

Group of Agents, one of which the Controller will choose to run this task (compare with Cluster Broadcast). You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.

# Agent Cluster Variable

Indication of whether the Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using an Agent Cluster reference to using an Agent Cluster variable, you must change the Agent Cluster Variable field to Yes and specify the Agent Cluster variable in the Agent Cluster Unresolved field. Conversely, to change from using an Agent Cluster variable to using an Agent Cluster reference, you must change the Agent Cluster Variable field to No and specify the Agent Cluster reference in the Agent Cluster field.

# Cluster Broadcast

Group of Agents, all of which will run this task (compare with Agent Cluster). You can specify a Cluster Broadcast in place of a specific Agent and/or agent cluster. Each instance of the task running on its own Agent becomes a separate task instance record in the database and displays separately on the Activity Monitor.

### Credentials

Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.

Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

## Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials Variable** field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

# Monitor Type

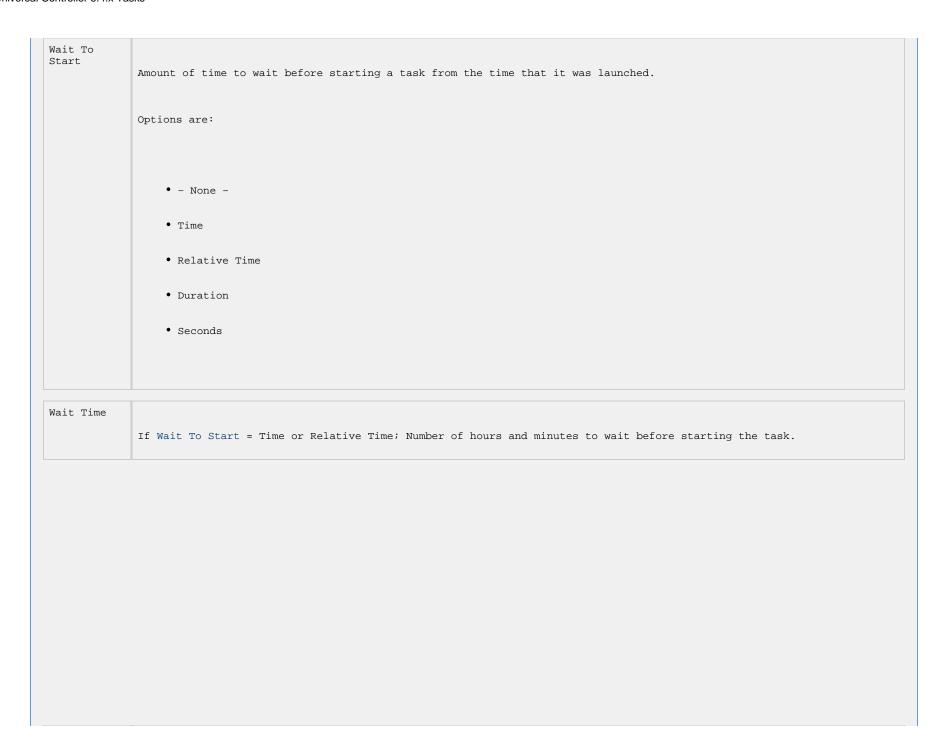

Type of file event being monitored for.

Options:

- Create Wait for the creation of one or more files.
- Delete Wait for the deletion of one or more files.
- Change Monitor for a change in one or more files. [NOTE: not supported for z/OS.]
- $\bullet$  Exists Check to see if one or more files already exist.
- Missing Check to see if one or more files do not exist.

Existence	
Monitor File(s)	Location and name of a specific file or file pattern (for example, ACT001*) being monitored. Variables supported. Wildcards supported.
Use Regular Expression	Enables the use of a regular expression in the Monitor File(s) field.
Recursive	
	If enabled, the monitor searches the specified directory and all subdirectories.
Maximum Files	If Monitor Type = Create, Delete, or Change; For searches that use wildcards, limits the number of files to be searched.
File Owner	If Monitor Type = Create, Delete, Change, or Exists; User name / group name of the owner of the file on the operating system; that is, the user name / group name returned by the operating system in the file ownership information. LDAP groups are supported. Specifying a file owner limits the search to files with that owner.
Stable (seconds)	If Monitor Type = Change or Create: Period of time, in seconds, during which the file has not changed (File Monitor checks the modification timestamp and the file size).
By Percentage (+/-)	If Monitor Type = Change, the amount that the file size has changed, expressed as a percentage of the original file size. For example, enter 10 to monitor for a change in file size of 10 percent (larger or smaller).
By Size (+/-)	If Monitor Type = Change, used in conjunction with the By Scale field, specifies an actual change in file size. For example, to monitor for a change in file size of 10 MB, enter 10 in this field and select MB in the By Scale field.

By Scale	
	If Monitor Type = Change, used in conjunction with the By Size field, specifies Bytes, KB (kilobytes), or MB (megabytes). For example, to monitor for a change in file size of 10MB, enter 10 in the By Size field and select MB in this field.
To Size	If Monitor Type = Change, used in conjunction with the To Scale field, specifies an actual file size that you want to monitor for. For example, to monitor for a file size of 5KB, enter 5 in this field and select KB in the To scale field
To Scale	monitor for example, to monitor for a fire size of SkB, enter 3 in this freed and select kB in the 10 scale freed
TO Scare	If Monitor Type = Change, used in conjunction with the To Size field, specifies an actual file size that you want to monitor for. For example, to monitor for a file size of 5KB, enter 5 in the To Size field and select KB in this field.
Scan Text	
	If Monitor Type = Change or Exists, or if Monitor Type = Create and a value for Stable (seconds) is specified; string that the monitor will search for in the file or files. Specifying a string means that only files containing the string constitute a match. The Controller will process this field as a regular expression.
	The result (string is found or not found) is set in the Trigger File Scan Result built-in variable.
Scan	
Forward	If Monitor Type = Change; if enabled, this field specifies that once the File Monitor has been satisfied, it should continue from where it left off. If it is scanning within a file, it should resume from the point in the file that it last scanned. If it is monitoring for files, it should resume monitoring for the next file.
	If you are scanning a file that is being overwritten each time and you want to start from the beginning each time, you should disable Scan Forward.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.

Wait Day Constraint If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day. Valid values: • -- None --• If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. • Same Day Do not advance day. • Next Day Advance to the next day. • Next Business Day Advance to the next business day. • Sunday If today is not Sunday, advance to next Sunday. • Monday If today is not Monday, advance to next Monday. • Tuesday If today is not Tuesday, advance to next Tuesday. • Wednesday If today is not Wednesday, advance to next Wednesday. • Thursday If today is not Thursday, advance to next Thursday. • Friday If today is not Friday, advance to next Friday. • Saturday If today is not Saturday, advance to next Saturday. Default is - None --.

f Wait To Start = Seconds; Number of seconds to wait before starting the task.
mount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; hat is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or here is no wait time specified.
ptions are:
• - None -
• Duration
• Seconds
f Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
f Delay On Start = Seconds; Number of seconds to delay after starting the task.
his section contains time-related specifications for the task instance.
pt

# Late Start If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details. Started Late System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields. Late Start Type Required if Late Start is enabled. Options: • Time - Flag the task if it starts after the specified time. • Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time. Late Start Time If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

```
Late Start
Day
Constraint
             If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
             Valid values:
                  • -- None --
                   Advance to the next day if the specified late start time is before the Created time of the task instance.
                  • Same Day
                   Do not advance day.
                  • Next Day
                   Advance to the next day.
                  • Next Business Day
                   Advance to the next business day.
                  • Sunday
                   If today is not Sunday, advance to next Sunday.
                  • Monday
                   If today is not Monday, advance to next Monday.
                  • Tuesday
                   If today is not Tuesday, advance to next Tuesday.
                  • Wednesday
                   If today is not Wednesday, advance to next Wednesday.
                  • Thursday
                   If today is not Thursday, advance to next Thursday.
                   If today is not Friday, advance to next Friday.
                  • Saturday
                   If today is not Saturday, advance to next Saturday.
                   Advance to a specific number of days in the future.
             Default is - None --.
```

#### Late Start Nth Amount

If Late Start Day Constraint = Nth Day; Number of days to advance.

### Late Start Duration

If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.

For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.

For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.

### Late Finish

If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

### Finished Late

System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.

## Late Finish Type

Required if Late Finish is enabled.

Options:

- Time Flag the task if it finishes after the specified time (see Late Finish Time).
- Duration Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.

### Late Finish Time

If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.

```
Late Finish
Day
Constraint
             If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.
             Valid values:
                  • -- None --
                   Advance to the next day if the specified late finish time is before the Created time of the task instance.
                  • Same Day
                   Do not advance day.
                  • Next Day
                   Advance to the next day.
                  • Next Business Day
                   Advance to the next business day.
                  • Sunday
                   If today is not Sunday, advance to next Sunday.
                  • Monday
                   If today is not Monday, advance to next Monday.
                  • Tuesday
                   If today is not Tuesday, advance to next Tuesday.
                  • Wednesday
                   If today is not Wednesday, advance to next Wednesday.
                  • Thursday
                   If today is not Thursday, advance to next Thursday.
                   If today is not Friday, advance to next Friday.
                  • Saturday
                   If today is not Saturday, advance to next Saturday.
                   Advance to a specific number of days in the future.
             Default is - None --.
```

# Late Finish Nth Amount If Late Finish Day Constraint = Nth Day; Number of days to advance. Late Finish Duration If Late Finish Type = Duration; Longest amount of time this task instance should take to run. Early Finish If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition. Finished Early System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields. Early Finish Type Required if Early Finish is enabled. Options: • Time - Flag the task if it finishes before the specified time (see Early Finish Time). • Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.

Early Finish Time If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time. Early Finish Day Constraint If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day. Valid values: • -- None --Advance to the next day if the specified early finish time is before the Created time of the task instance. • Same Day Do not advance day. • Next Day Advance to the next day. • Next Business Day Advance to the next business day. • Sunday If today is not Sunday, advance to next Sunday. • Monday If today is not Monday, advance to next Monday. • Tuesday If today is not Tuesday, advance to next Tuesday. • Wednesday If today is not Wednesday, advance to next Wednesday. • Thursday If today is not Thursday, advance to next Thursday. • Friday If today is not Friday, advance to next Friday. • Saturday If today is not Saturday, advance to next Saturday. Advance to a specific number of days in the future. Default is - None --.

# Early Finish Nth Amount If Early Finish Day Constraint = Nth Day; Number of days to advance. Early Finish Duration If Early Finish Type = Duration; Shortest amount of time this task instance should take to run. Critical This section contains Critical Path-related specifications for the task. Path Options CP Duration Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported. CP Duration (Resolved) Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.

## CP Duration Unit

Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select **Minutes** in this field.

Options:

- Seconds
- Minutes
- Hours

Default is Minutes.

### Workflow Execution Options

This section contains Execution Restriction specifications for the task if it is within a Workflow.

# Execution Restriction

Specification for whether or not there is a restriction for this task to be run, skipped, or held.

Options are:

- -- None --
- No restriction for this task.
- Run

Restriction for when this task will be run.

- Skir
- Restriction for when this task will be skipped.
- Hold

Restriction for when this task will be held.

If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

# Restriction Period If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted. Options are: • - None -No period of restriction for this task. • Before Restriction is valid if the date is before the Before Date value. • After Restriction is valid if the date is after the After Date value. • Span Restriction is valid if the date is before the Before Date value and after After Date value. • On Restriction is valid if the date is one of the Date List values. Before Date If Restriction Period = Before or Span; Date before which the restriction is valid. Before Time If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.

After Date	
	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instance.
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
Metadata	This section contains Metadata information about this record.

UUID	Universally Unique Identifier of this record.		
Updated By	Name of the user that last updated this record.		
Updated	Date and time that this record was last updated.		
Created By	Name of the user that created this record.		
Created	Date and time that this record was created.		
Status History	History of all statuses that the task instance has gone through.		
Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.		
Update	Saves updates to the record.		
Force Finish	See Force Finishing a Task.		
Hold	Places the task instance on Hold (see Putting a Task on Hold).		
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.		
Re-run	See Re-running a Task.		
View Parent	Displays the task instance Details for the parent Workflow of this task instance.		

Delete	
	Deletes the current record.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task instance.
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.
Virtual Resources	Lists all Virtual Resources to which this task is assigned.
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.
Notes	Lists all notes associated with this record.

## Monitoring Task Execution

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

Jnivers	versal Controller 6.4.x Tasks				

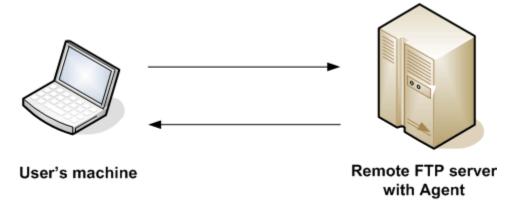

## **FTP File Monitor Task**

- Overview
- Built-In Variables
- · Creating an FTP File Monitor Task
  - FTP File Monitor Task Details
  - FTP File Monitor Task Details Field Descriptions
- Viewing an FTP File Monitor Task Instance
  - FTP File Monitor Task Instance Details
  - FTP File Monitor Task Instance Details Field Descriptions
- Running an FTP File Monitor Task
- Monitoring Task Execution
- Built-In Variables

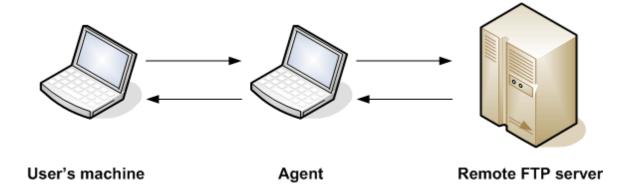

## Overview

The FTP File Monitor task allows you to monitor for a file on a remote machine where an FTP server is running. The FTP File Monitor connects to the FTP server rather than the machine's file system to monitor for files. The FTP File Monitor can be used only within a workflow; you cannot run a FTP File Monitor task based on a trigger. To run an FTP File Monitor task, you need Universal Agent to communicate with the FTP server. The Agent can, but does not have to be, running on the same machine as the FTP server.

In the following example, the user wants to monitor for a file on a remote FTP Server that has an Agent running on it. In this case, the login credentials for the Agent machine and the FTP server machine are the same.

In the following example, the user wants to monitor for a file on a remote FTP Server that does not have an Agent running on it. In this case, the FTP File Monitor task definition provides an address and login credentials for the machine where the Agent is running as well as address and login credentials for the FTP server.

## **Built-In Variables**

The following built-in variables can be used in an FTP File Monitor task to pass data where appropriate:

- Task Instance variables
   Agent-Based Task Instance variables
   FTP File Monitor Task variables

# **Creating an FTP File Monitor Task**

From the Automation Center navigation pane, select Tasks > FTP File Monitor Tasks. The FTP File Monitor Tasks list displays a list of all currently defined FTP File Monitor tasks. Below the list, FTP File Monitor Task Details for a new FTP File Monitor task displays. Dashboards 🛛 FTP File Monitors 🖸 ✓ 5 FTP File Monitors Custom Filter -- None --∨ Filter... 🔯 Go To... New | 2 Task Name \* Task Description Monitor Type Updated By stonebranch-ftpfilemonitortask-01 Exists ops.admin 2016-05-24 14:29:09 -0400 stonebranch-ftpfilemonitortask-02 Exists 2016-05-24 14:29:09 -0400 ops.admin stonebranch-ftpfilemonitortask-03 2016-05-24 14:29:09 -0400 ops.admin stonebranch-ftpfilemonitortask-04 2016-05-24 14:29:09 -0400 Fxists ops.admin stonebranch-ftpfilemonitortask-05 Exists ops.admin 2016-05-24 14:29:09 -0400 🔚 Save 🎼 Save & New 🛅 New FTP File Monitor Details General Task Description : Business Services : Resolve Name Time Zone - System Default -Immediately: Preference: Hold on Start : 🔳 Hold Resources on Virtual Resource 10 Priority: Failure: FTP File Monitor Details Agent: Agent Cluster: Agent Cluster Agent Variable : 🔲 Variable: Step 2 Enter/select Details for a new FTP File Monitor task, using the field descriptions below as a guide. Required fields display in boldface. • Default values for fields, if available, display automatically. To display more of the Details fields on the screen, you can either:

• Use the scroll bar.

• Temporarily hide the list above the Details.

• Click the **New** button above the list to display a pop-up version of the Details.

Step 3 Click a Save button. The task is added to the database, and all buttons and tabs in the Task Details are enabled.

#### Note

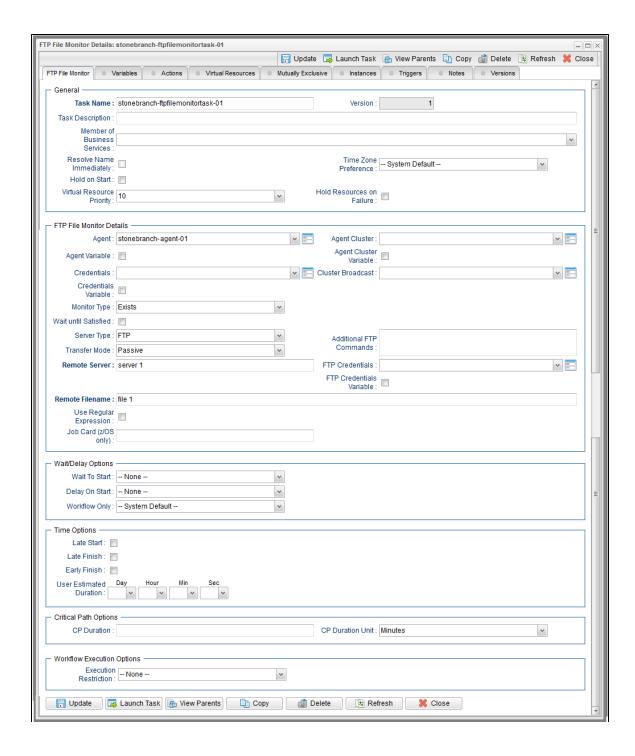

To open an existing record on the list, either:

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click **Open In Tab** in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

## **FTP File Monitor Task Details**

The following FTP File Monitor Task Details is for an existing File Monitor task.

Depending on the values that you enter / select for these fields, and whether or not the FTP File Monitor task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the FTP File Monitor Task Details.

# **FTP File Monitor Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the FTP File Monitor Task Details.

Field Name	Description	
General	This section contains general information about the task.	
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.	
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.	
Task Description	Description of this record. (Maximum = 200 characters.)	
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.	
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.	
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.	
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.	
Hold Reason	Information about why the task will be put on hold when it starts.	

Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.
Options: 1 (high) - 20 (low).  Default is 10.
If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
This section contains assorted detailed information about the task.
Name of the Agent resource that identifies the machine where the operation will run. If you do not specify an Agent, you must specify an Agent Cluster.
Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
Note When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the Agent Variable field to Yes and specify the Agent variable in the Agent Unresolved field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the Agent Variable field to No and specify the Agent reference in the Agent field.
Group of Agents, one of which the Controller will choose to run this task (compare with Cluster Broadcast). You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.
Indication of whether the Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
Note When updating multiple Tasks, to change from using an Agent Cluster reference to using an Agent Cluster variable, you must change the Agent Cluster Variable field to Yes and specify the Agent Cluster variable in the Agent Cluster Unresolved field. Conversely, to change from using an Agent Cluster variable to using an Agent Cluster reference, you must change the Agent Cluster Variable field to No and specify the Agent Cluster reference in the Agent Cluster field.

Cluster Broadcast	Group of Agents, all of which will run this task (compare with Agent Cluster). You can specify a Cluster Broadcast in place of a specific Agent and/or agent cluster. Each instance of the task running on its own Agent becomes a separate task instance record in the database and displays separately on the Activity Monitor.
Credentials	Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.  Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.
Credentials Variable	Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the Credentials Variable field to Yes and specify the Credentials variable in the Credentials Unresolved field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the Credentials Variable field to No and specify the Credentials reference in the Credentials field.
Monitor Type	Type of file event being monitored for.  Options:  Exists - Checks to see if the file exists.  Missing - Checks to see if the file does not exist.
Wait until Satisfied	If enabled, the task instance starts and continues to run until one of the following events occurs:  • If Monitor Type = Exists and the specified file exists or appears, the task instance completes with a status of SUCCESS.  • If Monitor Type = Missing and the specified file does not exist (or any part of the path is missing), or exists then disappears, the task instance completes with a status of SUCCESS.  If not enabled, the task instance:  1. Starts. 2. Checks for the existence of the file. 3. Takes one of the following actions:  • If Monitor Type = Exists and the file exists, the task instance completes with a status of SUCCESS.  • If Monitor Type = Exists and the file does not exist (or any part of the path is missing), the task instance completes with a status of FAILURE.  • If Monitor Type = Missing and the file does not exist (or any part of the path is missing), the task instance completes with a status of SUCCESS.
Poll Interval (Seconds)	If Wait until Satisfied is enabled: Frequency, in seconds, in which the FTP File Monitor will check to see if the file exists or is missing.

If Wait until Satisfied is enabled: Maximum number of times that the FTP File Monitor will check to see if the file exists or is missing.
If Wait until Satisfied is enabled: Period of time, in seconds, during which the file has not changed.
For an FTP/SFTP File Monitor task, a file's stability depends on its size. If the file size displayed in the FTP/SFTP output does not change during the specified number of seconds, the file is considered stable. In order for the task to reliably monitor the file's stability, the task must display a file's size in a well-known location. This means that the file list returned in the output must be in Unix long-listing format, as follows:
-rwxr-xr-x 1 owner group 12345 Jan 1 2016 somefile.txt
The task will only find the size if it is in the 5th column (for example, 12345 in the example above).
The default file list format varies across different FTP client/server implementations, but most support additional commands that can force the output to the required format. The Additional FTP Commands field is provided to insert those statements into the FTP script that the file monitor task executes.
Type of FTP server.
Options:
• FTP • SFTP • FTPS

# Additional FTP Commands

If Server Type is FTP or FTPS: Set of extra commands to be sent to the FTP server, such as optional statements that control the FTP output format.

The Agent depends on the file list being in Unix "long" format (that is, what you would see if you entered "Is -I" from the command shell) in order to correctly and reliably parse out file name and size (when a Stable period is specified). If the FTP Server is configured to return a different format, the Server may support commands that alter the format.

For example, the following statements may be used for an FTP File Monitor task executing against an IBM iSeries (AS/400) FTP Server to ensure a correctly formatted file list:

```
site listfmt 1
site namefmt 1
```

If the FTP File Monitor task is executing against a Microsoft FTP Server and that Server is configured to return a file list in DOS format, the following statement will toggle the format to a Unix-style listing.

```
site dirstyle
```

Not all FTP client/server implementations provide statements that can alter the format of the **Is** command, which the FTP File Monitor task issues to generate the file listing. However, those implementations may support the **dir** command, which can return the file list in the correct format. If the **dir** command is specified in the List Format Options field, the FTP File Monitor task will use the results from that command to obtain the file sizes. In such cases, the FTP script will contain the **dir** and **Is** commands, but since statements in the List Format Options field are inserted into the script prior the **Is** command, the results from the **dir** command are parsed first.

If the **dir** command is necessary to obtain the correct file list format, simply specify that command along with the same value specified in the Remote Filename field. For example, if Remote Filename is /uagtests/data/somefile\*.txt, enter the following in this field:

```
dir /uagtests/data/somefile*.txt
```

This statement also can be used with other commands to get the correct output. For example, if a Windows FTP Server is configured to return file lists in Windows format, use site and dir commands together in this field:

```
site dirstyle
dir /uagtests/data/somefile*.txt
```

Invalid statements or valid statements that do not control the file list format are ignored.

Transfer Mode	
	Transfer mode.
	Options:
	• Active
	Passive     Extended Passive
	Exicited Fassive
Remote Server	Name or IP address of the remote server. This machine may or may not be the same as the Universal Agent machine.
	You also can specify a non-standard FTP, SFTP, or FTPS port: port number separated from the host name with a colon: "some.server.com:2222".
FTP Credentials	Login credentials that the Agent will use to access the FTP or SFTP server machine. If the FTP File Monitor server and Agent are running on the same machine, enter the same credentials as those you entered in the Credentials field.
FTP Credentials Variable	Indication of whether the FTP Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the FTP Credentials as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using an FTP Credentials reference to using an FTP Credentials variable, you must change the FTP Credentials Variable field to Yes and specify the FTP Credentials variable in the FTP Credentials Unresolved field. Conversely, to change from using an FTP Credentials variable to using an FTP Credentials reference, you must change the FTP Credentials Variable field to No and specify the FTP Credentials reference in the FTP Credentials field.
Remote Filename	Path and file name on the remote server.
Use Regular Expression	Enables the use of a regular expression in the Remote Filename field.
Job Card (z/OS only)	For z/OS, the job card information for the JCL statement. Example:
	//File TransferJOB01 JOB (File Transfer,001),FANNY,MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID,CLASS=A
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.

Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	• — None — • Time
	<ul> <li>Relative Time</li> <li>Duration</li> <li>Seconds</li> </ul>
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	<ul> <li> None</li> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> <li>Same Day         <ul> <li>Same Day</li> <li>Do not advance day.</li> </ul> </li> </ul>
	Next Day Advance to the next day.  Next Business Day Advance to the next business day.  Sunday
	If today is not Sunday, advance to next Sunday.  Monday If today is not Monday, advance to next Monday.
	<ul> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> </ul>
	Thursday     If today is not Thursday, advance to next Thursday.      Friday
	If today is not Friday, advance to next Friday.  Saturday If today is not Saturday, advance to next Saturday.
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.

Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.  Options are:
	<ul> <li>- None -</li> <li>Duration</li> <li>Seconds</li> </ul>
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  Options are:
	<ul> <li> System Default Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.)</li> <li>Yes Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.</li> <li>No Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.</li> </ul>
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.
	<ul> <li>Time - Flag the task if it starts after the specified time.</li> <li>Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.</li> </ul>
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

Late Start Day	
Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
	Valid values:
	• None
	Advance to the next day if the specified late start time is before the Created time of the task instance.
	Same Day     Do not advance day.
	Next Day
	Advance to the next day.  • Next Business Day
	Advance to the next business day.
	Sunday     If today is not Sunday, advance to next Sunday.
	<ul> <li>Monday         If today is not Monday, advance to next Monday.     </li> </ul>
	• Tuesday
	If today is not Tuesday, advance to next Tuesday.  • Wednesday
	If today is not Wednesday, advance to next Wednesday.
	Thursday  If today is not Thursday, advance to next Thursday.
	• Friday
	If today is not Friday, advance to next Friday.  • Saturday
	If today is not Saturday, advance to next Saturday.  • Nth Day
	Advance to a specific number of days in the future.
	Default is – None
Late Start Nth	
Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start	Many Cont. To a Description (second of coloring to a) of contribution and in a contribution of coloring to a)
Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.
	For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.
	For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Late Finish Type	Required if Late Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.
	Valid values:
	None     Advance to the next day if the specified late finish time is before the Created time of the task instance.
	Same Day     Do not advance day.
	Next Day     Advance to the next day.
	Next Business Day
	Advance to the next business day.  • Sunday
	If today is not Sunday, advance to next Sunday.  • Monday
	If today is not Monday, advance to next Monday.
	Tuesday     If today is not Tuesday, advance to next Tuesday.
	Wednesday
	If today is not Wednesday, advance to next Wednesday.  • Thursday
	If today is not Thursday, advance to next Thursday.
	Friday     If today is not Friday, advance to next Friday.
	Saturday
	If today is not Saturday, advance to next Saturday.  • Nth Day
	Advance to a specific number of days in the future.
	Default is – None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.
Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.

Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.				
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish to				
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.				
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  • None Advance to the next day if the specified early finish time is before the Created time of the task instance. • Same Day Do not advance day. • Next Day Advance to the next day. • Next Business Day Advance to the next business day. • Sunday If today is not Sunday, advance to next Sunday. • Monday If today is not Monday, advance to next Monday. • Tuesday If today is not Tuesday, advance to next Tuesday. • Wednesday If today is not Tuesday, advance to next Wednesday. • Thursday If today is not Thursday, advance to next Thursday. • Friday If today is not Friday, advance to next Friday. • Saturday If today is not Advance to next Friday. • Saturday If today is not Saturday, advance to next Friday. • Saturday If today is not Saturday, advance to next Saturday. • Nth Day Advance to a specific number of days in the future.  Default is – None				

Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.				
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.				
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.				
Critical Path Options	This section contains Critical Path-related specifications for the task.				
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.				
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The C Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.				
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds  Minutes  Hours				
	Default is Minutes.				
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.				

Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.  Options are:  • None No restriction for this task.			
	<ul> <li>Run Restriction for when this task will be run.</li> <li>Skip Restriction for when this task will be skipped.</li> <li>Hold Restriction for when this task will be held.</li> </ul>			
	If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.			
Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.			
	Options are:  • - None - No period of restriction for this task. • Before Restriction is valid if the date is before the Before Date value. • After Restriction is valid if the date is after the After Date value. • Span Restriction is valid if the date is before the Before Date value and after After Date value.			
	<ul> <li>On         Restriction is valid if the date is one of the Date List values.     </li> </ul>			
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.			
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.			
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.			
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.			
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.			
First Time Ran	System-supplied; date and time this task first ran.			

Last Time Ran	System-supplied; date and time the task last ran.				
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.				
Lowest Instance Time	System-supplied; shortest amount of time this task has taken to run.				
Average Instance Time	System-supplied; average amount of time this task takes to run.				
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.				
Number of Instances	System-supplied; number of instances in the database for this task.				
Metadata	This section contains Metadata information about this record.				
UUID	Universally Unique Identifier of this record.				
Updated By	Name of the user that last updated this record.				
Updated	Date and time that this record was last updated.				
Created By	Name of the user that created this record.				
Created	Date and time that this record was created.				
Buttons	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.				
Save	Saves a new task record in the Controller database.				
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.				
Save & View	Saves a new record in the Controller database and continues to display that record.				
New	Displays empty (except for default values) Details for creating a new task.				
Update	Saves updates to the record.				
Launch Task	Manually launches the task.				
View Parents	Displays a list of any parent Workflow tasks for this task.				

eletes the current r				
Deletes the current record.				
•	not delete a task if it is either: Specified in an enabled Trigger. The only task specified in a disabled Trigger.			
efreshes any dyna	mic data displayed in the Details.			
For pop-up view only; closes the pop-up view of this task.				
This section identifies the tabs across the top of the Task Details that provide access to additional information about the task.				
Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.				
Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task.  Events are:  Task instance status Exit codes Late start Late finish Early finish  Actions are:				
Abort Action	Abort the task if certain events occur. For details, see Abort Actions.  Send an email if certain events occur. For details, see Email Notification Actions.			
Notification Set Variable	Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow.			
SNMP Notification	Send an email if certain events occur. For details, see SNMP Notification Actions.			
System Operation	Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions.			
	you can  freshes any dyna r pop-up view only is section identifie  sts all user-defined  ows you to specify ents are:  Task instan Exit codes Late start Late finish Early finish  tions are:  bort Action  mail lotification et Variable  NMP lotification ystem			

Virtual Resources	Lists all Virtual Resources to which this task is assigned.
Mutually Exclusive	Lists all tasks that have been set to be mutually exclusive of this task.
Instances	Lists all instances of this task.
Triggers	List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current name="" task="">#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers.</current>
Notes	Lists all notes associated with this record.
Versions	Stores copies of all previous versions of the current record. See Record Versioning.

# **Viewing an FTP File Monitor Task Instance**

When an FTP File Monitor task is launched, the Controller creates a task instance record of that task.

A task instance contains detailed information about a single execution of that task.

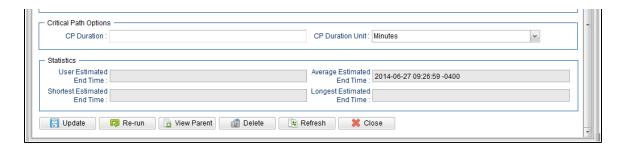

You can access a task instance from:

- Instances tab on the FTP File Monitor Task Details for that task
- Activity Monitor
- Task Instances list

#### **FTP File Monitor Task Instance Details**

The following FTP File Monitor Task Instance Details contains information on the execution of the task shown in the FTP File Monitor Task Details.

FTP File Monitor Instanc	e Details: stonebranch-ftpfilemonitortask-01

# **FTP File Monitor Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in FTP File Monitor Task Instance Details.

Field Name	Description
General	This section contains general information about the task instance.
Instance Name	Name of this task instance.
Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.
Invoked by	System-supplied; how the task instance was launched.  Options:  Trigger: (Trigger Name) Instance was launched by the named trigger.  Workflow: (Workflow Name) Instance was launched by the named workflow.  Manually Launched Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.

Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.
	Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)

Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.
End Time	System-supplied; Date and time the task instance completed.
Duration	System-supplied; amount of time the task instance took to run.
File Monitor Details	This section contains assorted detailed information about the task instance.
Agent	Name of the Agent resource that identifies the machine where the operation will run. If you do not specify an Agent, you must specify an Agent Cluster.
Agent Variable	Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the Agent Variable field to Yes and specify the Agent variable in the Agent Unresolved field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the Agent Variable field to No and specify the Agent reference in the Agent field.

# Agent Cluster Group of Agents, one of which the Controller will choose to run this task (compare with Cluster Broadcast). You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information. Agent Cluster Variable Indication of whether the Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions. Note When updating multiple Tasks, to change from using an Agent Cluster reference to using an Agent Cluster variable, you must change the Agent Cluster Variable field to Yes and specify the Agent Cluster variable in the Agent Cluster Unresolved field. Conversely, to change from using an Agent Cluster variable to using an Agent Cluster reference, you must change the Agent Cluster Variable field to No and specify the Agent Cluster reference in the Agent Cluster field. Cluster Group of Agents, all of which will run this task (compare with Agent Cluster). You can specify a Cluster Broadcast in place of a specific Agent and/or agent cluster. Each Broadcast instance of the task running on its own Agent becomes a separate task instance record in the database and displays separately on the Activity Monitor. Credentials Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task. Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur. Credentials Variable Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions. Note When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the Credentials Variable field to Yes and specify the Credentials variable in the Credentials Unresolved field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the Credentials Variable field to No and specify the Credentials reference in the Credentials field. Monitor Type Type of file event being monitored for. Options: Exists - Checks to see if the file exists. · Missing - Checks to see if the file does not exist.

## Wait until Satisfied If enabled, the task instance starts and continues to run until one of the following events occurs: If Monitor Type = Exists and the specified file exists or appears, the task instance completes with a status of SUCCESS. • If Monitor Type = Missing and the specified file does not exist (or any part of the path is missing), or exists then disappears, the task instance completes with a status of SUCCESS. If not enabled, the task instance: 1. Starts. 2. Checks for the existence of the file. 3. Takes one of the following actions: If Monitor Type = Exists and the file exists, the task instance completes with a status of SUCCESS. If Monitor Type = Exists and the file does not exist (or any part of the path is missing), the task instance completes with a status of FAILURE. If Monitor Type = Missing and the file exists, the task instance completes with a status of FAILURE. If Monitor Type = Missing and the file does not exist (or any part of the path is missing), the task instance completes with a status of SUCCESS. Poll Interval If Wait until Satisfied is enabled: Frequency, in seconds, in which the FTP File Monitor will check to see if the file exists or is missing. (Seconds) Maximum Polls If Wait until Satisfied is enabled: Maximum number of times that the FTP File Monitor will check to see if the file exists or is missing. If Wait until Satisfied is enabled: Period of time, in seconds, during which the file has not changed. Stable (Seconds) For an FTP/SFTP File Monitor task, a file's stability depends on its size. If the file size displayed in the FTP/SFTP output does not change during the specified number of seconds, the file is considered stable. In order for the task to reliably monitor the file's stability, the task must display a file's size in a well-known location. This means that the file list returned in the output must be in Unix long-listing format, as follows: -rwxr-xr-x 1 owner group 12345 Jan 1 2016 somefile.txt The task will only find the size if it is in the 5th column (for example, 12345 in the example above). The default file list format varies across different FTP client/server implementations, but most support additional commands that can force the output to the required format. The Additional FTP Commands field is provided to insert those statements into the FTP script that the File Monitor task executes. By default, if a value for Stable (Seconds) is specified, an FTP File Monitor task instance will verify that the Agent version is 5.1.0.16 or higher. If the Agent version is 5.1.0.15 or lower, the task instance will not run, the status will be set to Start Failure, and the following message will be logged: Stable (Seconds) option only supported on Agent 5.1.0.16 or higher. Server Type Type of FTP server. Options: • FTP SFTP FTPS

# Additional FTP Commands

If Server Type is FTP or FTPS: Set of extra commands to be sent to the FTP server, such as optional statements that control the FTP output format.

The Agent depends on the file list being in Unix "long" format (that is, what you would see if you entered "Is -I" from the command shell) in order to correctly and reliably parse out file name and size (when a Stable period is specified). If the FTP Server is configured to return a different format, the Server may support commands that alter the format.

For example, the following statements may be used for an FTP File Monitor task executing against an IBM iSeries (AS/400) FTP Server to ensure a correctly formatted file list:

```
site listfmt 1
site namefmt 1
```

If the FTP File Monitor task is executing against a Microsoft FTP Server and that Server is configured to return a file list in DOS format, the following statement will toggle the format to a Unix-style listing.

```
site dirstyle
```

Not all FTP client/server implementations provide statements that can alter the format of the **Is** command, which the FTP File Monitor task issues to generate the file listing. However, those implementations may support the **dir** command, which can return the file list in the correct format. If the **dir** command is specified in the List Format Options field, the FTP File Monitor task will use the results from that command to obtain the file sizes. In such cases, the FTP script will contain the **dir** and **Is** commands, but since statements in the List Format Options field are inserted into the script prior the **Is** command, the results from the **dir** command are parsed first.

If the **dir** command is necessary to obtain the correct file list format, simply specify that command along with the same value specified in the Remote Filename field. For example, if Remote Filename is /uagtests/data/somefile\*.txt, enter the following in this field:

```
dir /uagtests/data/somefile*.txt
```

This statement also can be used with other commands to get the correct output. For example, if a Windows FTP Server is configured to return file lists in Windows format, use site and dir commands together in this field:

```
site dirstyle
dir /uagtests/data/somefile*.txt
```

Invalid statements or valid statements that do not control the file list format are ignored.

Transfer Mode	Transfer mode.
	Options:
	<ul> <li>Active</li> <li>Passive</li> <li>Extended Passive</li> </ul>
Remote Server	Name or IP address of the File Transfer server. This machine may or may not be the same as the Universal Agent machine.
	You also can specify a non-standard FTP, SFTP, or FTPS port: port number separated from the host name with a colon: "some.server.com:2222".
FTP Credentials	Login credentials that the Agent will use to access the FTP or SFTP server machine. If the FTP File Monitor server and Agent are running on the same machine, enter the same credentials as those you entered in the Credentials field.
FTP Credentials Variable	Indication of whether the FTP Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the FTP Credentials as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using an FTP Credentials reference to using an FTP Credentials variable, you must change the FTP Credentials Variable field to Yes and specify the FTP Credentials variable in the FTP Credentials Unresolved field. Conversely, to change from using an FTP Credentials variable to using an FTP Credentials reference, you must change the FTP Credentials Variable field to No and specify the FTP Credentials reference in the FTP Credentials field.
Remote Filename	Path and file name on the remote server.
Use Regular Expression	Enables the use of a regular expression in the Remote Filename field.
Job Card (z/OS only)	For z/OS, the job card information for the JCL statement. Example:
	//File TransferJOB01 JOB (File Transfer,001),FANNY,MSGCLASS=X,MSGLEVEL=(1,1),NOTIFY=&SYSUID,CLASS=A
z/OS ID (z/OS only)	z/OS execID, used internally by the z/OS Agent to identify each z/OS task.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.

ne to wait before starting a task from the time that it was launched.

ay
łay is not Friday, advance to next Friday. rday
lay is not Saturday, advance to next Saturday.
lone
art = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.

Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.  Options are:  - None -  Duration - Seconds
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  Options are:  System Default Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.) - Yes Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  No Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Specifies the amount of time to wait before starting a task after it has been launched.  Options are:  - None -  Time Duration Seconds
Wait Time	If Wait To Start = Time; Number of hours and minutes to wait before starting the task.

Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.
Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.
	Options are:
	<ul> <li>None –</li> <li>Duration</li> <li>Seconds</li> </ul>
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Time Options	This section contains time-related specifications for the task instance.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start Type	Required if Late Start is enabled.
	Options:
	<ul> <li>Time - Flag the task if it starts after the specified time.</li> <li>Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.</li> </ul>
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
	Valid values:
	<ul> <li> None Advance to the next day if the specified late start time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday</li> </ul>
	If today is not Sunday, advance to next Sunday.  Monday If today is not Monday, advance to next Monday.  Tuesday If today is not Tuesday, advance to next Tuesday.
	<ul> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday</li> </ul>
	If today is not Thursday, advance to next Thursday.  Friday If today is not Friday, advance to next Friday.  Saturday If today is not Saturday, advance to next Saturday.
	Nth Day     Advance to a specific number of days in the future.  Default is – None
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.
	For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.
	For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None     Advance to the next day if the specified late finish time is before the Created time of the task instance.  • Same Day     Do not advance day.  • Next Day     Advance to the next day.  • Next Business Day     Advance to the next business day.  • Sunday     If today is not Sunday, advance to next Sunday.  • Monday     If today is not Monday, advance to next Monday.  • Tuesday     If today is not Tuesday, advance to next Tuesday.  • Wednesday     If today is not Wednesday, advance to next Wednesday.  • Thursday     If today is not Thursday, advance to next Thursday.  • Friday     If today is not Friday, advance to next Friday.  • Saturday     If today is not Friday, advance to next Friday.  • Saturday     If today is not Saturday, advance to next Friday.  • Saturday     If today is not Saturday, advance to next Saturday.  • Nth Day     Advance to a specific number of days in the future.  Default is None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early Finish Day	16 Fault Finish Time. Times Consideration for substhess and at the advance the control finish time to enable a day.
Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.
	Valid values:
	<ul> <li> None</li> <li>Advance to the next day if the specified early finish time is before the Created time of the task instance.</li> </ul>
	Same Day     Do not advance day.
	Next Day     Advance to the next day.
	Next Business Day
	Advance to the next business day.  • Sunday
	If today is not Sunday, advance to next Sunday.  • Monday
	If today is not Monday, advance to next Monday.  • Tuesday
	If today is not Tuesday, advance to next Tuesday.  • Wednesday
	If today is not Wednesday, advance to next Wednesday.
	Thursday     If today is not Thursday, advance to next Thursday.
	Friday     If today is not Friday, advance to next Friday.
	Saturday     If today is not Saturday, advance to next Saturday.
	Nth Day     Advance to a specific number of days in the future.
	Default is – None
	Default is - None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish	
Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.

CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds Minutes Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.
Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.  Options are:  • None No restriction for this task. • Run Restriction for when this task will be run. • Skip Restriction for when this task will be skipped. • Hold Restriction for when this task will be held.  If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.
Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.  Options are:  - None - No period of restriction for this task Before Restriction is valid if the date is before the Before Date value After Restriction is valid if the date is after the After Date value Span Restriction is valid if the date is before the Before Date value and after After Date value On Restriction is valid if the date is one of the Date List values.

Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instance.
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Status History	History of all statuses that the task instance has gone through.
Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.

Update	Saves updates to the record.
Force Finish	See Force Finishing a Task.
Hold	Places the task instance on Hold (see Putting a Task on Hold).
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.
Re-run	See Re-running a Task.
View Parent	Displays the task instance Details for the parent Workflow of this task instance.
Retrieve Output	See Retrieving Output.
Delete	Deletes the current record.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task instance.
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.
Virtual Resources	Lists all Virtual Resources to which this task is assigned.
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.
Output	Displays output generated from the process, if any, based on specifications provided by the user in the Monitor Type fields in the task Details. Output also can be obtained by clicking the Retrieve Output button.
Notes	Lists all notes associated with this record.

# **Running an FTP File Monitor Task**

You can run an FTP File Monitor task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the FTP File Monitor Tasks list or FTP File Monitor Task Details Action menu.
- As part of a Workflow.
- Specify triggers that run the task automatically based on times or events.

# **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

## **Built-In Variables**

The built-in variables outlined below can be used in an FTP File Monitor task to pass data where appropriate:

- Task and Task Instance Variables
- FTP File Monitor Variables.

# **System Monitor Task**

- Overview
- Built-In Variables
- Creating a System Monitor Task
  - System Monitor Task Details
  - System Monitor Task Details Field Descriptions
- Viewing a System Monitor Task Instance
  - System Monitor Task Instance Details
  - System Monitor Task Instance Details Field Descriptions
- Running a System Monitor Task
- Monitoring Task Execution

#### Overview

The System Monitor task allows you to monitor a specific remote machine and check for free disk space. You might use this task to check for sufficient disk space before running a task on it that requires a specific amount. In order for this task to execute, the remote machine must have Universal Agent running on it.

#### **Built-In Variables**

The following built-in variables can be used in a System Monitor task to pass data where appropriate:

- Task Instance variables
- Agent-Based Task Instance variables
- System Monitor Task variables

## **Creating a System Monitor Task**

From the Automation Center navigation pane, select Tasks > System Monitor Tasks. The System Monitor Tasks list displays a list of all currently defined System Monitor tasks. Below the list, System Monitor Task Details for a new System Monitor task displays. Dashboards 🖾 System Monitors 🖾 Custom Filter -- None --✓ 5 System Monitors 🗸 🦁 Filter... 🔯 Go To... | 🙀 New | 🏖 Task Name \* Task Description Monitor Type Updated By stonebranch-systemmonitor-01 Diskspace Free ops.admin 2016-05-24 14:29:09 -0400 stonebranch-systemmonitor-02 2016-05-24 14:29:09 -0400 Diskspace Free ops.admin stonebranch-systemmonitor-03 Diskspace Free ops.admin 2016-05-24 14:29:09 -0400 stonebranch-systemmonitor-04 Diskspace Free ops.admin 2016-05-24 14:29:09 -0400 stonebranch-systemmonitor-05 Diskspace Free ops.admin 2016-05-24 14:29:09 -0400 🔚 Save 🎼 Save & New 🗀 New System Monitor Details System Monitor Task Name: Task Description: Member of Business Services : Resolve Name Time Zone - System Default -~ Immediately: Preference: Hold on Start : 🔲 Hold Resources on Virtual Resource 10 Priority: Failure: System Monitor Details Agent Cluster: Agent: Agent Cluster Agent Variable : 🔲 Variable : Step 2 Enter/select Details for a new System Monitor task, using the field descriptions below as a guide. Required fields display in boldface. Default values for fields, if available, display automatically. To display more of the Details fields on the screen, you can either: • Use the scroll bar. • Temporarily hide the list above the Details. • Click the **New** button above the list to display a pop-up version of the Details.

Step 3 Click a Save button. The task is added to the database, and all buttons and tabs in the Task Details are enabled.

#### Note

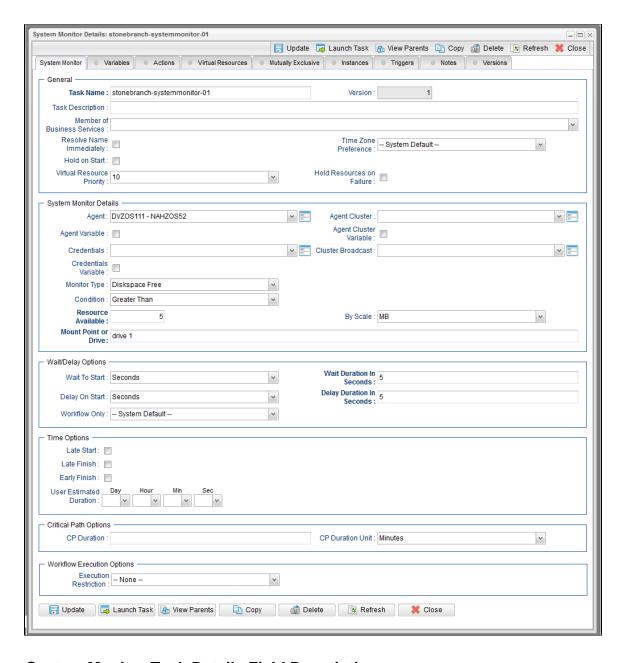

To open an existing record on the list, either:

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click **Open In Tab** in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

### **System Monitor Task Details**

The following System Monitor Task Details is for an existing System Monitor task.

Depending on the values that you enter / select for these fields, and whether or not the System Monitor task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the System Monitor Task Details.

# **System Monitor Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the System Monitor Task Details.

Field Name	Description
General	This section contains general information about the task.
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.
	Options:
	<ul> <li>System Default –         Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxx)         Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.</li> <li>Inherited         Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.</li> </ul>
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.
Hold Reason	Information about why the task will be put on hold when it starts.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.

Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
System Monitor Details	This section contains assorted detailed information about the task.
Agent	Name of the Agent resource that identifies the machine where the operation will run. If you do not specify an Agent, you must specify an Agent Cluster.
Agent Variable	Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the Agent Variable field to Yes and specify the Agent variable in the Agent Unresolved field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the Agent Variable field to No and specify the Agent reference in the Agent field.
Agent Cluster	Group of Agents, one of which the Controller will choose to run this task (compare with Cluster Broadcast). You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.
Agent Cluster Variable	Indication of whether the Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using an Agent Cluster reference to using an Agent Cluster variable, you must change the Agent Cluster Variable field to Yes and specify the Agent Cluster variable in the Agent Cluster Unresolved field. Conversely, to change from using an Agent Cluster variable to using an Agent Cluster reference, you must change the Agent Cluster Variable field to No and specify the Agent Cluster reference in the Agent Cluster field.
Cluster Broadcast	Group of Agents, all of which will run this task (compare with Agent Cluster). You can specify a Cluster Broadcast in place of a specific Agent and/or agent cluster. Each instance of the task running on its own Agent becomes a separate task instance record in the database and displays separately on the Activity Monitor.

or Drive  Wait / Delay Options	Use this field to limit the check to a specific mount point or drive, such as drive C: for Windows.  This section contains specifications for waiting to start and/or delaying on start the task.
By Scale  Mount Point	Scale of the number you entered in the Resource Available field. Options: KB (kilobyte), MB (megabyte), GB (gigabyte).
Resource Available	Used in conjunction with the By Scale field. Enter a number indicating the amount of the resource you are checking for. For example, to check to see if the machine has at least 1GB of free diskspace, select Greater Than in the Condition field, enter 1 in the Resource Available field, and select GB in the By Scale field.
Condition	Specifies whether you want to check for free disk space greater than or less than the amount specified in the Resource Available field.
Monitor Type	Type of system status to monitor for.  Options:  • Diskspace Free
	Note When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the Credentials Variable field to Yes and specify the Credentials variable in the Credentials Unresolved field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the Credentials Variable field to No and specify the Credentials reference in the Credentials field.
Credentials Variable	Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
Credentials	Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.  Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	• - None -
	• Time
	<ul> <li>Relative Time</li> <li>Duration</li> </ul>
	Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	• None
	<ul> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task</li> </ul>
	instance.  • Same Day Do not advance day.
	<ul> <li>Next Day Advance to the next day.</li> <li>Next Business Day</li> </ul>
	Advance to the next business day.  • Sunday
	If today is not Sunday, advance to next Sunday.  • Monday
	If today is not Monday, advance to next Monday.
	Tuesday     If today is not Tuesday, advance to next Tuesday.
	Wednesday     If today is not Wednesday, advance to next Wednesday.
	Thursday     If today is not Thursday, advance to next Thursday.
	Friday
	If today is not Friday, advance to next Friday.  • Saturday
	If today is not Saturday, advance to next Saturday.
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.

Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.
	Options are:
	<ul> <li>None –</li> <li>Duration</li> <li>Seconds</li> </ul>
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.
	Options are:
	<ul> <li> System Default         Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.)</li> <li>Yes</li> </ul>
	Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  • No
	Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.
	Options:
	<ul> <li>Time - Flag the task if it starts after the specified time.</li> <li>Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.</li> </ul>

Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.
Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
	Valid values:
	<ul> <li> None Advance to the next day if the specified late start time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> </ul>
	Next Business Day     Advance to the next business day.
	• Sunday
	If today is not Sunday, advance to next Sunday.  • Monday
	If today is not Monday, advance to next Monday.  • Tuesday
	If today is not Tuesday, advance to next Tuesday.  • Wednesday
	If today is not Wednesday, advance to next Wednesday.
	Thursday     If today is not Thursday, advance to next Thursday.
	Friday     If today is not Friday, advance to next Friday.
	Saturday  If today is not Saturday, advance to next Saturday.
	Nth Day
	Advance to a specific number of days in the future.
	Default is – None
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start	If the Count Time District District (amount of relative time) of the solid in annulation day have a total late
Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.
	For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.
	For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.

If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.
Required if Late Finish is enabled.
Options:
<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:
- None Advance to the next day if the specified late finish time is before the Created time of the task instance.  Same Day Do not advance day.  Next Day Advance to the next day.  Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday.  Monday If today is not Monday, advance to next Monday.  Tuesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Wednesday, advance to next Wednesday.  Thursday If today is not Thursday, advance to next Thursday.  Thursday If today is not Thursday, advance to next Thursday.  Thursday If today is not Friday, advance to next Friday.  Saturday If today is not Saturday, advance to next Saturday.  Nth Day Advance to a specific number of days in the future.  Default is - None
If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Early Finish Type	Required if Early Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes before the specified time (see Early Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.</li> </ul>
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:
	<ul> <li>None Advance to the next day if the specified early finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday If today is not Tuesday, advance to next Wednesday.</li> <li>Thursday If today is not Thursday, advance to next Hornsday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul>
	Default is – None

Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds Minutes Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.

# Execution Restriction Specification for whether or not there is a restriction for this task to be run, skipped, or held. Options are: -- None -- No restriction for this task. • Run Restriction for when this task will be run. • Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held. If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow. Restriction Period If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted. Options are: • - None -No period of restriction for this task. Restriction is valid if the date is before the Before Date value. Restriction is valid if the date is after the After Date value. Restriction is valid if the date is before the Before Date value and after After Date value. On Restriction is valid if the date is one of the Date List values. Before Date If Restriction Period = Before or Span; Date before which the restriction is valid. Before If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid. Time After Date If Restriction Period = After or Span; Date after which the restriction is valid. After Time If Restriction Period = After or Span; Time on the selected date after which the restriction is valid. Date List If Restriction Period = On; Date(s) on which the restriction is valid. **Statistics** This section contains time-related statistics for task instances of the task.

First Time Ran	System-supplied; date and time this task first ran.
Last Time Ran	System-supplied; date and time the task last ran.
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.
Lowest Instance Time	System-supplied; shortest amount of time this task has taken to run.
Average Instance Time	System-supplied; average amount of time this task takes to run.
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.
Number of Instances	System-supplied; number of instances in the database for this task.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Buttons	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Save	Saves a new task record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new task.
Update	Saves updates to the record.

Launch Task	Manually launches the task.
View Parents	Displays a list of any parent Workflow tasks for this task.
Сору	Creates a copy of this task, which you are prompted to rename.
Delete	Note You cannot delete a task if it is either:  Specified in an enabled Trigger.  The only task specified in a disabled Trigger.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task.
Tabs	This section identifies the tabs across the top of the Task Details that provide access to additional information about the task.
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.

### Actions Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task. Events are: Task instance status Exit codes Late start Late finish Early finish Actions are: Abort the task if certain events occur. For details, see Abort Actions. **Abort Action** Send an email if certain events occur. For details, see Email Notification Actions. **Email** Notification **Set Variable** Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow. **SNMP** Send an email if certain events occur. For details, see SNMP Notification Actions. Notification Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions. System Operation Virtual Lists all Virtual Resources to which this task is assigned. Resources Mutually Lists all tasks that have been set to be mutually exclusive of this task. **Exclusive** Lists all instances of this Workflow. Instances **Triggers** List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current task name>#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers. Notes Lists all notes associated with this record. Versions Stores copies of all previous versions of the current record. See Record Versioning.

### **Viewing a System Monitor Task Instance**

When a System Monitor task is launched, the Controller creates a task instance record of that task.

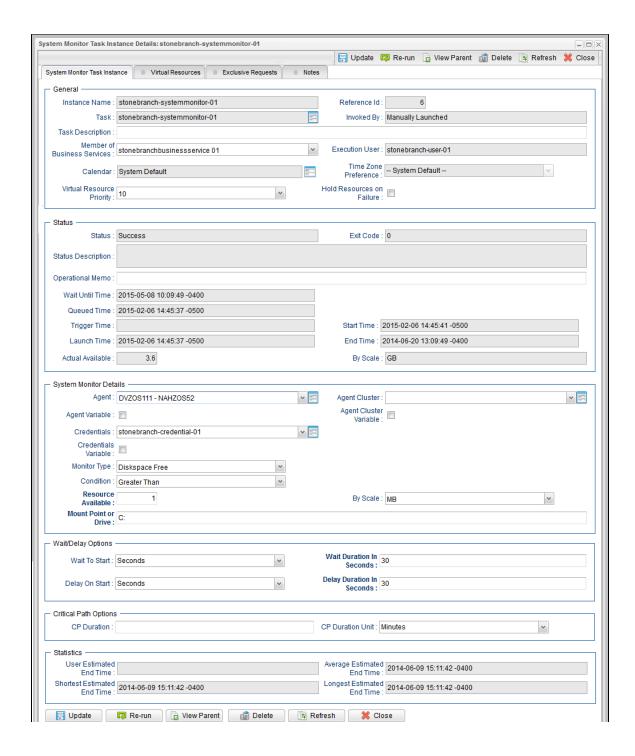

A task instance contains detailed information about a single execution of that task.

You can access a task instance from:

- Instances tab on the System Monitor Task Details for that task
   Activity Monitor
- Task Instances list

### **System Monitor Task Instance Details**

The following System Monitor Task Instance Details contains information on the execution of the task shown in the System Monitor Task Details.

# **System Monitor Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in System Monitor Task Instance Details.

Description
This section contains general information about the task instance.
Name of this task instance.
System-supplied; the Controller increments this number each time the task is run.
Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.
System-supplied; how the task instance was launched.  Options:  Trigger: (Trigger Name) Instance was launched by the named trigger.  Workflow: (Workflow Name) Instance was launched by the named workflow.  Manually Launched Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.
Description of this record. (Maximum = 200 characters.)
User-defined; allows you to select one or more Business Services that this record belongs to.
System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar associated with the task instance.

Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:
	<ul> <li>System Default –         Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxx)         Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.</li> <li>Inherited         Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.</li> </ul>
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)
Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.

System-supplied; Date and time the task was queued for processing.
System-supplied; Date and time the task instance was triggered.
System-supplied; Date and time the task instance was launched.
System-supplied; Date and time the task instance started.
System-supplied; Date and time the task instance completed.
System-supplied; amount of time the task instance took to run.
Amount of free disk space on the specified system.
Scale of the number show in the Actual Available field.  Options:  • KB (kilobyte)  • MB (megabyte)  • GB (gigabyte)
This section contains assorted detailed information about the task instance.
Name of the Agent resource that identifies the machine where the operation will run. If you do not specify an Agent, you must specify an Agent Cluster.
Indication of whether the Agent field is a reference field for selecting a specific Agent (unchecked) or a text field for specifying the Agent as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
Note When updating multiple Tasks, to change from using an Agent reference to using an Agent variable, you must change the Agent Variable field to Yes and specify the Agent variable in the Agent Unresolved field. Conversely, to change from using an Agent variable to using an Agent reference, you must change the Agent Variable field to No and specify the Agent reference in the Agent field.

### Agent Cluster

Group of Agents, one of which the Controller will choose to run this task (compare with Cluster Broadcast). You can specify an agent cluster in addition to or in place of a specific Agent. If you specify an Agent and an agent cluster, the Controller first tries to run the task on the specific agent. If the Agent is not available, the Controller reverts to the agent cluster. See Agent Clusters for more information.

### Agent Cluster Variable

Indication of whether the Agent Cluster field is a reference field for selecting a specific Agent Cluster (unchecked) or a text field for specifying the Agent Cluster as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using an Agent Cluster reference to using an Agent Cluster variable, you must change the **Agent Cluster Variable** field to **Yes** and specify the Agent Cluster variable in the **Agent Cluster Unresolved** field. Conversely, to change from using an Agent Cluster variable to using an Agent Cluster reference, you must change the **Agent Cluster Variable** field to **No** and specify the Agent Cluster reference in the **Agent Cluster** field.

### Cluster Broadcast

Group of Agents, all of which will run this task (compare with Agent Cluster). You can specify a Cluster Broadcast in place of a specific Agent and/or agent cluster. Each instance of the task running on its own Agent becomes a separate task instance record in the database and displays separately on the Activity Monitor.

#### Credentials

Credentials under which an Agent runs this task. These Credentials override any Credentials provided in the Agent Details for any Agent running this task.

Required if the Agent Credentials Required Universal Controller system property is true. When required, if the Credential is specified as a variable, and the variable resolves to blank, a Start Failure will occur.

#### Credentials Variable

Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

#### Note

When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the **Credentials Variable** field to **Yes** and specify the Credentials variable in the **Credentials Unresolved** field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the **Credentials Variable** field to **No** and specify the Credentials reference in the **Credentials** field.

#### Monitor Type

Type of file event being monitored for.

#### Options:

- Create Wait for the creation of one or more files.
- Delete Wait for the deletion of one or more files.
- Change Monitor for a change in one or more files. [NOTE: not supported for z/OS.]
- Exists Check to see if one or more files already exist.
- · Missing Check to see if one or more files do not exist.

Condition	Specifies whether you want to check for free disk space greater than or less than the amount specified in the Resource Available field.
Resource Available	Used in conjunction with the By Scale field. Enter a number indicating the amount of the resource you are checking for. For example, to check to see if the machine has at least 1GB of free diskspace, select Greater Than in the Condition field, enter 1 in the Resource Available field, and select GB in the By Scale field.
By Scale	Scale of the number you entered in the Resource Available field. Options: KB (kilobyte), MB (megabyte), GB (gigabyte).
Mount Point or Drive	Use this field to limit the check to a specific mount point or drive, such as drive C: for Windows.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.  Options are:  - None - Time Relative Time Duration Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

### Wait Day Constraint If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day. Valid values: -- None --• If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. Same Day Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Default is - None --. Wait If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task. Duration Wait Duration In If Wait To Start = Seconds; Number of seconds to wait before starting the task. Seconds Delay On Start Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified. Options are: None – Duration Seconds

Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Time Options	This section contains time-related specifications for the task instance.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.

### Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday, Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future. Default is - None --. Late Start Nth If Late Start Day Constraint = Nth Day; Number of days to advance. Amount Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  • None Advance to the next day if the specified early finish time is before the Created time of the task instance.  • Same Day  Do not advance day.  • Next Day  Advance to the next day.  • Next Business Day  Advance to the next business day.  • Sunday  If today is not Sunday, advance to next Sunday.  • Monday  If today is not Monday, advance to next Monday.  • Tuesday  If today is not Tuesday, advance to next Tuesday.  • Wednesday  If today is not Tuesday, advance to next Wednesday.  • Thursday  If today is not Thursday, advance to next Thursday.  • Friday  If today is not Friday, advance to next Friday.  • Saturday  If today is not Saturday, advance to next Saturday.  • Nith Day  Advance to a specific number of days in the future.  Default is - None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.

### CP Duration (Resolved)

Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.

### CP Duration Unit

Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select **Minutes** in this field

#### Options:

- Seconds
- Minutes
- Hours

#### Default is Minutes.

# Workflow Execution Options

This section contains Execution Restriction specifications for the task if it is within a Workflow.

# Execution Restriction

Specification for whether or not there is a restriction for this task to be run, skipped, or held.

#### Options are:

- · -- None -- No restriction for this task.
- Run Restriction for when this task will be run.
- Skip Restriction for when this task will be skipped.
- Hold Restriction for when this task will be held.

If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

#### Restriction Period

If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.

#### Options are:

- - None -
  - No period of restriction for this task.
- Before
  - Restriction is valid if the date is before the Before Date value.
- After
  - Restriction is valid if the date is after the After Date value.
- Span
- Restriction is valid if the date is before the Before Date value and after After Date value.
- On

Restriction is valid if the date is one of the Date List values.

Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instance.
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Status History	History of all statuses that the task instance has gone through.

Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.
Update	Saves updates to the record.
Force Finish	See Force Finishing a Task.
Hold	Places the task instance on Hold (see Putting a Task on Hold).
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.
Re-run	See Re-running a Task.
View Parent	Displays the task instance Details for the parent Workflow of this task instance.
Delete	Deletes the current record.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task instance.
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.
Virtual Resources	Lists all Virtual Resources to which this task is assigned.
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.
Notes	Lists all notes associated with this record.

# **Running a System Monitor Task**

You can run a System Monitor task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the System Monitor Tasks list or System Monitor Task Details Action menu.
- As part of a workflow.Specify triggers that run the task automatically based on times or events.

# **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

### **Variable Monitor Task**

- Overview
- Variable Values to Monitor
  - Monitoring for the Current Value of a Variable
  - Monitoring for a Change in the Value of a Variable
  - Monitoring for Current Value of a Variable and a Change in the Value of a Variable
- Built-In Variables
- Creating a Variable Monitor Task
  - Variable Monitor Task Details
  - Variable Monitor Task Details Field Descriptions
- Viewing a Variable Monitor Task Instance
  - Variable Monitor Task Instance Details
  - Variable Monitor Task Instance Details Field Descriptions
- Running a Variable Monitor Task
- Monitoring Task Execution

### Overview

The Variable Monitor task allows you to monitor the value of a Global Variable.

### **Variable Values to Monitor**

The Variable Monitor task lets you monitor for:

- Current value of a Global Variable.
- Change in the value of a Global Variable.
- Both current value and change in the value of a Global Variable.

### Monitoring for the Current Value of a Variable

- If the Variable To Monitor exists and its current value matches the Variable Monitor conditions, the Variable Monitor task instance will transition to a Success status; otherwise, it will transition to a Failed status.
- If the Variable To Monitor does not exist (or the Execution User does not have Read permission for the Global Variable) and the Value Condition field is **undefined**, the Variable Monitor task instance will transition to a **Success** status; otherwise, it will transition to a **Failed** status.

### Monitoring for a Change in the Value of a Variable

- The Variable Monitor task instance will not check the current value of the Variable To Monitor, but it will monitor for changes to the Variable To Monitor value. If a change to the Variable To Monitor value matches the Variable Monitor conditions, the Variable Monitor task instance will transition to a **Success** status; otherwise, it will to continue to monitor for changes to the Variable To Monitor value.
- The Variable Monitor task instance will monitor indefinitely for the Variable Monitor conditions to be met unless you specify a value in the Time Limit field. The Variable Monitor task instance will transition to a **Failed** status if the Variable Monitor conditions are not met within the specified Time Limit.

#### Note

- A Variable Monitor task instance will not detect changes to a Global Variable Value if the Execution User does not have Read permission for the Global Variable.
- Setting the Global Variable Value to the same value from the Universal Controller user interface, CLI, or web service is not considered a change.
- Only changes to the Global Variable Name (case-insensitive) and Global Variable Value will be considered a change in value to the Global Variable. That is, changes to the Description and/or Member of Business Services fields alone will not be considered a change in value to the Global Variable.

### Monitoring for Current Value of a Variable and a Change in the Value of a Variable

- If the Variable To Monitor exists and its current value matches the Variable Monitor conditions, the Variable Monitor task instance will transition to a Success status; otherwise, it will continue to monitor as though Variable To Monitor is Change.
- If the Variable To Monitor does not exist (or the Execution User does not have Read permission for the Global Variable) and the Value Condition is **undefined**, the Variable Monitor task instance will transition to a **Success** status; otherwise, it will continue to monitor as though Value Monitor Type is **Change**.

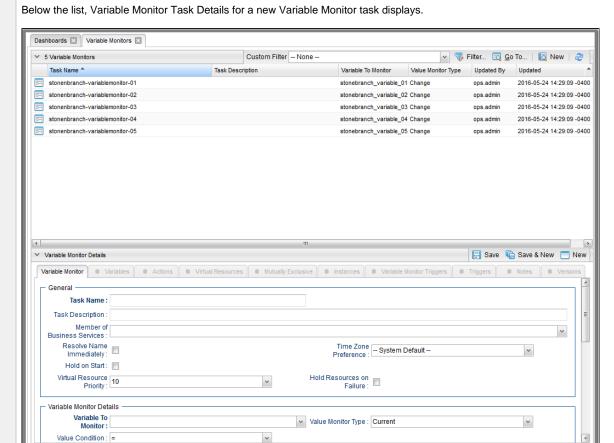

### **Built-In Variables**

When the Variable Monitor conditions are met, the following built-in variables will be set for the Variable Monitor task instance:

- Variable Monitor Task Instance/Trigger Variables
- Task Instance Variables

### **Creating a Variable Monitor Task**

Step 1 From the Automation Center navigation pane, select Tasks > Variable Monitor Tasks. The Variable Monitor Tasks list displays a list of all currently defined Variable Monitor tasks.

Step 2 Enter/select Details for a new Variable Monitor task, using the field descriptions below as a guide.

- Required fields display in boldface.
- · Default values for fields, if available, display automatically.

To display more of the Details fields on the screen, you can either:

- · Use the scroll bar.
- Temporarily hide the list above the Details.
- Click the **New** button above the list to display a pop-up version of the Details.

Step 3 Click a Save button. The task is added to the database, and all buttons and tabs in the Task Details are enabled.

#### Note

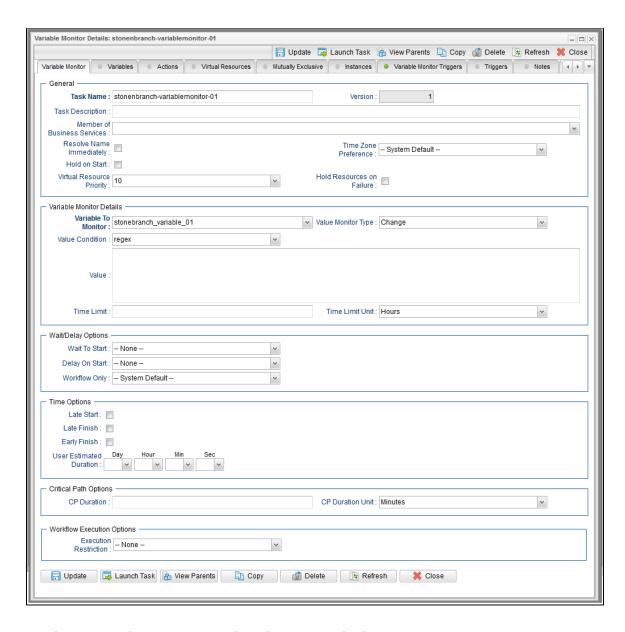

To open an existing record on the list, either:

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click **Open In Tab** in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

### **Variable Monitor Task Details**

The following Variable Monitor Task Details is for an existing Variable Monitor task.

Depending on the values that you enter / select for these fields, and whether or not the Variable Monitor task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the Variable Monitor Task Details.

### **Variable Monitor Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the Variable Monitor Task Details.

Field Name	Description
General	This section contains general information about the task.
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.
	Options:
	<ul> <li>System Default –         Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxx)         Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.</li> <li>Inherited</li> </ul>
	Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.
Hold Reason	Information about why the task will be put on hold when it starts.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).
	Default is 10.

Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Variable Monitor Details	This section contains assorted detailed information about the task.
Variable to Monitor	Name of the variable to monitor. Variables are supported.
Value Monitor Type	Type of monitoring to be done on the Variable value.  Options:  Current (monitor the current value) Change (monitor for a change in value) Current/Change (monitor for both the current value and a change in value)
	- Current/Criange (monitor for both the current value and a change in value)
Value Condition	Condition for the value of the variable being monitored.  Options:  - None = - != - != - > - > - > - < - < - < - < - < - < - < - < - < - <
Value	If Value Condition = =, !=, >, >=, <, <=, or regex; Value of the variable being monitored.
Time Limit	If Value Monitor Type = Change or Current/Change; Used for Variable Monitor tasks not associated with a trigger; Amount of time (in units specified by Time Limit Unit) to monitor for the Variable Monitor conditions to be met. The Time Limit duration is always relative to the start time of the Variable Monitor task instance.
Time Limit Unit	If Value Monitor Type = Change or Current/Change; Unit of time to use for Time Limit.  Options:  Minutes Hours (default) Days

Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	<ul> <li>None –</li> <li>Time</li> <li>Relative Time</li> <li>Duration</li> <li>Seconds</li> </ul>
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	<ul> <li>None — <ul> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance.</li> <li>Same Day</li> <li>Do not advance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> </ul> </li> <li>Same Day <ul> <li>Do not advance day.</li> </ul> </li> <li>Next Day <ul> <li>Advance to the next day.</li> </ul> </li> <li>Next Business Day <ul> <li>Advance to the next business day.</li> </ul> </li> <li>Sunday <ul> <li>If today is not Sunday, advance to next Sunday.</li> </ul> </li> <li>Monday <ul> <li>If today is not Monday, advance to next Monday.</li> </ul> </li> <li>Tuesday <ul> <li>If today is not Tuesday, advance to next Wednesday.</li> </ul> </li> <li>Thursday <ul> <li>If today is not Wednesday, advance to next Thursday.</li> </ul> </li> <li>Friday <ul> <li>If today is not Thursday, advance to next Friday.</li> </ul> </li> <li>Saturday <ul> <li>If today is not Friday, advance to next Friday.</li> </ul> </li> <li>Saturday <ul> <li>If today is not Saturday, advance to next Saturday.</li> </ul> </li> </ul>
	Default is – None

Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.
Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.  Options are:  - None -  Duration Seconds
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  Options are:  System Default Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.)  Yes Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  No Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.

Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.
Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.  Valid values:  None Advance to the next day if the specified late start time is before the Created time of the task instance Same Day Do not advance day Next Day Advance to the next day Next Business Day Advance to the next business day Sunday If today is not Sunday, advance to next Sunday Monday If today is not Monday, advance to next Monday To advance to Monday, advance to next Monday.
	<ul> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul> Default is - None
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.

of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.  For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 m and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.  Late Finish  If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish		
Late Finish Late Finish Late Finish Late Finish Finish Late Finish		For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration
If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished a specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.  Late Finish Type  Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.		For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Type Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.  Late Finish	Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.
		Options:  • Time - Flag the task if it finishes after the specified time (see Late Finish Time).
		If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.

### Late Finish If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late finish time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future. Default is - None --. Late Finish Nth Amount If Late Finish Day Constraint = Nth Day; Number of days to advance. Late Finish Duration If Late Finish Type = Duration; Longest amount of time this task instance should take to run. Early Finish If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition. Early Finish Type Required if Early Finish is enabled. Options: Time - Flag the task if it finishes before the specified time (see Early Finish Time). Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.

Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:
	- None Advance to the next day if the specified early finish time is before the Created time of the task instance.  Same Day Do not advance day.  Next Day Advance to the next day.  Next Business Day Advance to the next business day.  Sunday If today is not Sunday, advance to next Sunday.  Monday If today is not Monday, advance to next Monday.  Tuesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Wednesday, advance to next Wednesday.  Thursday If today is not Thursday, advance to next Thursday.  Thursday If today is not Triday, advance to next Thursday.  Friday If today is not Friday, advance to next Friday.  Saturday If today is not Saturday, advance to next Saturday.  Nth Day Advance to a specific number of days in the future.  Default is - None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Critical Path Options	This section contains Critical Path-related specifications for the task.

CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds Minutes Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.
Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.  Options are:  • None No restriction for this task. • Run Restriction for when this task will be run. • Skip Restriction for when this task will be skipped. • Hold Restriction for when this task will be held.  If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

Restriction	
Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.
	Options are:
	<ul> <li>None –</li> <li>No period of restriction for this task.</li> </ul>
	Before
	Restriction is valid if the date is before the Before Date value.  • After
	Restriction is valid if the date is after the After Date value.  • Span
	Restriction is valid if the date is before the Before Date value and after After Date value.  • On
	Restriction is valid if the date is one of the Date List values.
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for task instances of the task.
First Time	
Ran	System-supplied; date and time this task first ran.
Last Time	Sustant supplied, data and time the took last ren
Ran	System-supplied; date and time the task last ran.
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.
Lowest	
Instance Time	System-supplied; shortest amount of time this task has taken to run.

System-supplied; average amount of time this task takes to run.
System-supplied; longest amount of time this task has taken to run.
System-supplied; number of instances in the database for this task.
This section contains Metadata information about this record.
Universally Unique Identifier of this record.
Name of the user that last updated this record.
Date and time that this record was last updated.
Name of the user that created this record.
Date and time that this record was created.
This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Saves a new task record in the Controller database.
Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Saves a new record in the Controller database and continues to display that record.
Displays empty (except for default values) Details for creating a new task.
Saves updates to the record.
Manually launches the task.
Displays a list of any parent Workflow tasks for this task.
Creates a copy of this task, which you are prompted to rename.

#### Delete

Deletes the current record.

#### Note

You cannot delete a task if it is either:

- Specified in an enabled Trigger.The only task specified in a disabled Trigger.

Refresh	Refreshes any dynamic data displayed in the Details.	
Vellezii	incliesiles ally dyliallic data displayed ill tile Details.	

For pop-up view only; closes the pop-up view of this task. Close

Tabs This section identifies the tabs across the top of the Task Details that provide access to additional information about the task.

### **Variables**

Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.

#### **Actions**

Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task.

### Events are:

- Task instance status
- Exit codes
- Late start
- Late finish
- Early finish

### Actions are:

<b>Abort Action</b>	Abort the task if certain events occur. For details, see Abort Actions.
Email Notification	Send an email if certain events occur. For details, see Email Notification Actions.
Set Variable	Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow.
SNMP Notification	Send an email if certain events occur. For details, see SNMP Notification Actions.
System Operation	Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions.

### Virtual Resources

Lists all Virtual Resources to which this task is assigned.

Mutually Exclusive	Lists all tasks that have been set to be mutually exclusive of this task.
Instances	Lists all instances of this Workflow.
Variable Monitor Triggers	Lists all Variable Monitor triggers that reference this task in the Variable Monitor field of the trigger Details; that is; a list of all Variable Monitor triggers that execute this task. Also allows you to add new triggers. For instructions on creating triggers, see Triggers.
Triggers	List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current name="" task="">#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers.</current>
Notes	Lists all notes associated with this record.
Versions	Stores copies of all previous versions of the current record. See Record Versioning.

### **Viewing a Variable Monitor Task Instance**

When a Variable Monitor task is launched, the Controller creates a task instance record of that task.

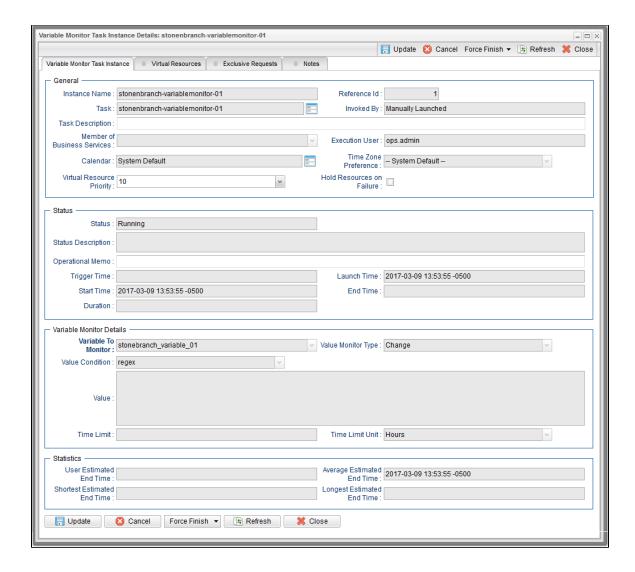

A task instance contains detailed information about a single execution of that task.

You can access a task instance from:

- Instances tab on the Variable Monitor Task Details for that task
- Activity MonitorTask Instances list

### **Variable Monitor Task Instance Details**

The following Variable Monitor Task Instance Details contains information on the execution of the task shown in the Variable Monitor Task Details.

# **Variable Monitor Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in Variable Monitor Task Instance Details.

Field Name	Description	
General	This section contains general information about the task instance.	

Instance Name	Name of this task instance.
Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.
Invoked by	System-supplied; how the task instance was launched.  Options:  Trigger: (Trigger Name) Instance was launched by the named trigger.  Workflow: (Workflow Name) Instance was launched by the named workflow.  Manually Launched Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.

Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)
Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.

End Time	System-supplied; Date and time the task instance completed.							
Duration	System-supplied; amount of time the task instance took to run.							
Variable Monitor Details	This section contains assorted detailed information about the task instance.							
Variable to Monitor	Name of the variable to monitor. Variables are supported.							
Value Monitor Type	Variable value(s) to monitor for.  Options:  Current Change Current/Change							
Value Condition	Condition for the value of the variable being monitored.  Options:  - None – (only if Value Monitor Type = Change) - = - != - != - > - > - > - < - < - < - < - < - < - < - < - < - <							
Value	If Value Condition = =, !=, >, >=, <, <=, or regex; Value of the variable being monitored.							
Time Limit	If Value Monitor Type = Change or Current/Change; Used for Variable Monitor tasks not associated with a trigger; Amount of time (in units specified by Time Limit Unit) to monitor for the Variable Monitor conditions to be met. The Time Limit duration is always relative to the start time of the Variable Monitor task instance.							
Time Limit Unit	If Value Monitor Type = Change or Current/Change; Unit of time to use for Time Limit.  Options:  Minutes Hours (default) Days							
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.							

Wait To Start	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	• - None - • Time
	<ul><li>Relative Time</li><li>Duration</li></ul>
	• Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.
	Valid values:
	• None
	<ul> <li>If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.</li> <li>If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.</li> </ul>
	<ul> <li>Same Day Do not advance day.</li> <li>Next Day</li> </ul>
	Advance to the next day.  Next Business Day
	Advance to the next business day.  • Sunday If today is not Sunday, advance to next Sunday.
	Monday     If today is not Monday, advance to next Monday.  If today is not Monday, advance to next Monday.
	Tuesday If today is not Tuesday, advance to next Tuesday.  Mednesday.
	<ul> <li>Wednesday</li> <li>If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday</li> </ul>
	If today is not Thursday, advance to next Thursday.  • Friday
	If today is not Friday, advance to next Friday.
	<ul> <li>Saturday         If today is not Saturday, advance to next Saturday.     </li> </ul>
	Default is – None
Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.

Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.  Options are:  - None -  Duration Seconds
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Time Options	This section contains time-related specifications for the task instance.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

### Late Start If Late Start Type = Time; Specification for whether or not to advance the late start time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late start time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday, Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future. Default is - None --. Late Start Nth If Late Start Day Constraint = Nth Day; Number of days to advance. Amount Late Start Duration If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late. For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late. For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late. Late Finish If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.						
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.						
Finished Early	stem-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.						
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.						
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.						

Farly								
Constraint Validation	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.							
Constraint	Valid values:							
	<ul> <li> None Advance to the next day if the specified early finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday</li> </ul>							
	If today is not Tuesday, advance to next Tuesday.  • Wednesday If today is not Wednesday, advance to next Wednesday.  • Thursday If today is not Thursday, advance to next Thursday.  • Friday If today is not Friday, advance to next Friday.							
	<ul> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul>							
	Default is – None							
Finish Nth	If Early Finish Day Constraint = Nth Day; Number of days to advance.							
Finish	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.							
	This section contains Critical Path-related specifications for the task.							
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.							

### CP Duration (Resolved)

Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.

### CP Duration Unit

Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select **Minutes** in this field

#### Options:

- Seconds
- Minutes
- Hours

#### Default is Minutes.

# Workflow Execution Options

This section contains Execution Restriction specifications for the task if it is within a Workflow.

# Execution Restriction

Specification for whether or not there is a restriction for this task to be run, skipped, or held.

#### Options are:

- -- None -- No restriction for this task.
- Run Restriction for when this task will be run.
- Skip Restriction for when this task will be skipped.
- Hold Restriction for when this task will be held.

If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

### Restriction Period

If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.

#### Options are:

- - None -
- No period of restriction for this task.
- Before
- Restriction is valid if the date is before the Before Date value.
- After
  - Restriction is valid if the date is after the After Date value.
- Span
- Restriction is valid if the date is before the Before Date value and after After Date value.
- On

Restriction is valid if the date is one of the Date List values.

Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.							
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.							
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.							
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.							
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.							
Statistics	This section contains time-related statistics for the task instance.							
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.							
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.							
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.							
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.							
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.							
Metadata	This section contains Metadata information about this record.							
UUID	Universally Unique Identifier of this record.							
Updated By	Name of the user that last updated this record.							
Updated	Date and time that this record was last updated.							
Created By	Name of the user that created this record.							
Created	Date and time that this record was created.							
Status History	History of all statuses that the task instance has gone through.							

Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.							
Update	Saves updates to the record.							
Force Finish	See Force Finishing a Task.							
Hold	Places the task instance on Hold (see Putting a Task on Hold).							
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.							
Re-run	See Re-running a Task.							
View Parent	Displays the task instance Details for the parent Workflow of this task instance.							
Delete	Deletes the current record.							
Refresh	Refreshes any dynamic data displayed in the Details.							
Close	For pop-up view only; closes the pop-up view of this task instance.							
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.							
Virtual Resources	Lists all Virtual Resources to which this task is assigned.							
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.							
Notes	Lists all notes associated with this record.							

# **Running a Variable Monitor Task**

You can run a Variable Monitor task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the Variable Monitor Tasks list or Variable Monitor Task Details Action menu.
- As part of a workflow.Specify triggers that run the task automatically based on times or events.

# **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

# **Email Monitor Task**

- Overview
- Built-In Variables
- Creating an Email Monitor Task
  - Email Monitor Task Details
  - Email Monitor Task Details Field Descriptions
  - Advanced Criteria
  - Advanced Criteria Field Descriptions
- Viewing an Email Monitor Task Instance
   Email Monitor Task Instance Details

  - Email Monitor Task Instance Details Field Descriptions
- Running an Email Monitor Task
- Monitoring Task Execution

### Overview

The Email Monitor task allows you to monitor a Mailbox Folder for emails matching specific criteria, and to take action on any matching emails.

### **Built-In Variables**

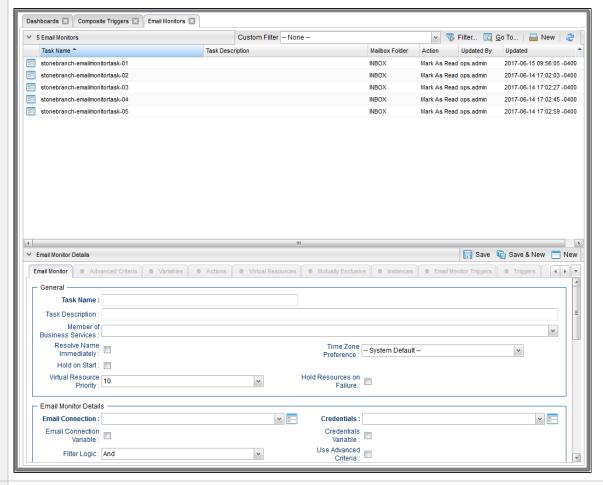

The following built-in variables can be used in an Email Monitor task to pass data where appropriate:

- Task Instance variables
- Email Monitor Task variables

# **Creating an Email Monitor Task**

Step 1 From the Automation Center navigation pane, select **Tasks > Email Monitors**. The Email Monitor Tasks list displays a list of all currently defined Email Monitor tasks.

Below the list, Email Monitor Task Details for a new Email Monitor task displays.

Step 2 Enter/select Details for a new Email Monitor task, using the field descriptions below as a guide.

- Required fields display in **boldface**.
- Default values for fields, if available, display automatically.

To display more of the Details fields on the screen, you can either:

- Use the scroll bar.
- Temporarily hide the list above the Details.
- Click the New button above the list to display a pop-up version of the Details.

Step 3 Click a Save button. The task is added to the database, and all buttons and tabs in the Task Details are enabled.

#### Note

To open an existing record on the list, either:

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click Open In Tab in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

### **Email Monitor Task Details**

The following Email Monitor Task Details is for an existing Email Monitor task.

Depending on the values that you enter / select for these fields, and whether or not the Email Monitor task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the Email Monitor Task Details.

# **Email Monitor Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the Email Monitor Task Details.

Field Name	Description
General	This section contains general information about the task.
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  • - System Default -
	Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.  Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.  Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.

Hold Reason	Information about why the task will be put on hold when it starts.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Email Monitor Details	This section contains assorted detailed information about the task.
Email Connection	Required; Name of an incoming Email Connection (Type = Incoming). An Email Connection specifies information about an outgoing or incoming email server. Enter the name of an existing incoming Email Connection, select an existing incoming Email Connection from the drop-down list, or clear the Email Connection field and click the Details icon to create a new Email Connection (Incoming will be pre-selected in the Type field).
Email Connection Variable	Indication of whether the Email Connection field is a reference field for selecting a specific Email Connection (unchecked) or a text field for specifying the Email Connection as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using an Email Connection reference to using an Email Connection variable, you must change the Email Connection Variable field to Yes and specify the Email Connection variable in the Email Connection Unresolved field. Conversely, to change from using an Email Connection variable to using an Email Connection reference, you must change the Email Connection Variable field to No and specify the Email Connection reference in the Email Connection field.
Credentials	Credentials to be used to connect to the Email server.

## Credentials Variable Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions. Note When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the Credentials Variable field to Yes and specify the Credentials variable in the Credentials Unresolved field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the Credentials Variable field to No and specify the Credentials reference in the Credentials field. Filter Logic Logic to apply when combining filters. If Use Advanced Criteria is enabled, it is the logic to apply when combining Advanced Criteria records. Options: And (default) • Or Use If enabled, use advanced criteria specified under the Advanced Criteria tab for the Email Monitor filter criteria. Advanced Criteria Sent Restriction Type of Sent restriction to apply. Options: - - None - - (default) • On Before After Span Sent On If Sent Restriction = On; Sent On restriction value. Options: • Date (default) Today Yesterday Tomorrow Sent On Date If Sent On = Date; Specific date for the Sent On restriction value.

Sent Before	If Sent Restriction = Before; Sent Before restriction value.
	Options:
	<ul> <li>Date (default)</li> <li>Today</li> <li>Yesterday</li> <li>Tomorrow</li> <li>Launch Time</li> </ul>
	Relative
Sent Before Date	If Sent Before = Date; Specific date for the Sent Before restriction value.
Sent Before Offset	If Sent Before = Relative; Offset, relative to the last launch time, for the Sent Before restriction value. Format: [+/-]hh:mm
Sent After	If Sent Restriction = After; Sent After restriction value.
	Options:
	<ul> <li>Date (default)</li> <li>Today</li> <li>Yesterday</li> <li>Tomorrow</li> <li>Launch Time</li> <li>Relative</li> </ul>
Sent After Date	If Sent After = Date; Specific date for the Sent After restriction value.
Sent After Offset	If Sent After = Relative; Offset, relative to the last launch time, for the Sent After restriction value.
Received Restriction	Type of Received restriction to apply.
	Options:
	• None (default)
	• On
	<ul><li>Before</li><li>After</li></ul>
	• Span

Received On	If Received Restriction = On; Received On restriction value.
	Options:
	<ul> <li>Date (default)</li> <li>Today</li> <li>Yesterday</li> <li>Tomorrow</li> </ul>
Received On Date	If Received On = Date; Specific date for the Received On restriction value.
Received Before	If Received Restriction = Before; Received Before restriction value.
	Options:
	<ul> <li>Date (default)</li> <li>Today</li> <li>Yesterday</li> <li>Tomorrow</li> <li>Relative</li> </ul>
Received Before Date	If Received Before = Date; Specific date for the Received Before restriction value.
Received Before Offset	If Received Before = Relative; Offset, relative to the last launch time, for the Received Before restriction value. Format: [+/-]hh:mm
Received After	If Received Restriction = After; Received After restriction value.
	Options:
	<ul> <li>Date (default)</li> <li>Today</li> <li>Yesterday</li> <li>Tomorrow</li> <li>Relative</li> </ul>
Received After Date	If Received After = Date; Specific date for the Received After restriction value.
Received After Offset	If Received After = Relative; Offset, relative to the last launch time, for the Received After restriction value.

Include Read Mail	If enabled, specifies that mail marked as read should be included by the filter.
Mailbox Folder	Mailbox folder to monitor on the server specified in the selected Email Connection.
Action	Action to take on mail that matches the filter.  Options:  Mark As Read (default) Delete Delete/Mark As Read Move Move Move/Mark As Read
Move To Trash	If Action = Delete or Delete/Mark As Read; If enabled, mail matching the filter will be moved to the trash folder specified in the Email Connection.
Mailbox Folder Destination	If Action = Move or Move/Mark As Read; Mailbox folder to move matched mail into.
Body Variables	Specifies whether to parse the Email body for name/value pairs to create variables from.  Options:  None No processing of the Email body will occur.  Within Body Entire body of the Email will be scanned for a "=" (equal sign) and any lines containing a "=" will be variablized as long as the text to the left of the "=" conforms to the naming standards for variables.  Within Default Markers Marker begin and end values are defined by the Email Body Default Begin Marker and Email Body Default End Marker Universal Controller system properties.  Within Custom Markers Marker begin and end values are defined in the Begin Marker and End Marker fields.  If markers are used, all lines of the Email body between the begin and end markers will be variablized in accordance to java properties. Any lines of the Email body outside the markers will be ignored w/r variablization.
Begin Marker	If Body Variables is Within Customer Markers; Begin marker for the Body Variables.
End Marker	If Body Variables is Within Customer Markers; End marker for the Body Variables.

Time Limit	Used for Email Monitor tasks not associated with a trigger; Amount of time (in units specified by Time Limit Unit) to monitor for the Email Monitor conditions to be met. The Time Limit duration is always relative to the start time of the Email Monitor task instance.
Time Limit Unit	Unit of time to use for Time Limit.  Options:  Minutes Hours (default) Days
Email Content Processing	Method for determining the success or failure of this task based on Email content.  Options:  None Success Body Contains Failure Body Contains Success Body Does Not Contain Failure Body Does Not Contain Success Subject Contains Failure Subject Contains Failure Subject Contains Failure Subject Does Not Contain
Content Value	Required if Email Content Processing is not None; Content Value to be matched in the email.
Case Sensitive Content	If Email Content Processing is not None; Indication of whether or not matching will be performed in a case sensitive manner.
Email Monitor Criteria	This section contains criteria for selecting emails to monitor.

F F:::	
From Filter	Type of From filter condition to apply.
	Options:
	<ul> <li> None (default)</li> <li>Equals</li> <li>Contains</li> <li>Does Not Equal</li> <li>Does Not Contain</li> </ul>
	• Regex
From	If From Filter = any value other than None; From filter condition value.
To Filter	Type of To filter condition to apply.
	Options:
	<ul> <li> None (default)</li> <li>Equals</li> <li>Contains</li> <li>Does Not Equal</li> <li>Does Not Contain</li> <li>Is Blank</li> <li>Is Not Blank</li> <li>Regex</li> </ul>
То	If To Filter = Equals, Contains, Does Not Equal, Does Not Contain, or Regex; To filter condition value.
Cc Filter	Type of Cc filter condition to apply.
	Options:      None (default)     Equals     Contains     Does Not Equal     Does Not Contain     Is Blank     Is Not Blank     Regex
Сс	If Cc Filter = Equals, Contains, Does Not Equal, Does Not Contain, or Regex; Cc filter condition value.

Subject Filter	Type of Subject filter condition to apply.
	Options:
	<ul> <li> None (default)</li> <li>Equals</li> <li>Starts With</li> <li>Contains</li> <li>Ends With</li> <li>Does Not Equal</li> <li>Does Not Start With</li> <li>Does Not Contain</li> <li>Does Not End With</li> <li>Is Blank</li> <li>Is Not Blank</li> <li>Regex</li> </ul>
Subject	If Subject Filter = anything other than None, Is Blank, or Is Not Blank; Subject filter condition value.
Body Filter	Type of Body filter condition to apply.
	Options:
	<ul> <li> None (default)</li> <li>Equals</li> <li>Starts With</li> <li>Contains</li> <li>Ends With</li> <li>Does Not Equal</li> <li>Does Not Start With</li> <li>Does Not Contain</li> <li>Does Not End With</li> <li>Is Blank</li> <li>Is Not Blank</li> <li>Regex</li> </ul>
Body	If Body Filter = anything other than None, Is Blank, or Is Not Blank; Body filter condition value.
	Note If an email being monitored does not contain the body in plain text, but only in HTML format, a plain text body will be generated from the HTML body content.
Case Sensitive	If enabled, text-based filters should be treated as case-sensitive.

Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.  Options are:  - None - Time Relative Time Duration Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.  Valid values:  • None  • If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors.  • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance.  • Same Day  Do not advance day.  • Next Day  Advance to the next day.  • Next Business Day  Advance to the next business day.  • Sunday  If today is not Sunday, advance to next Sunday.  • Monday  If today is not Tuesday, advance to next Tuesday.  • Wednesday  If today is not Tuesday, advance to next Thursday.  • Friday  If today is not Thursday, advance to next Thursday.  • Friday  If today is not Friday, advance to next Friday.  • Saturday  If today is not Friday, advance to next Saturday.  Default is — None:

Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.
Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.  Options are:  - None -  Duration Seconds
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  Options are:  System Default     Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.)  Yes     Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  No     Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related statistics for task instances of the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.

Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.
Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.  Valid values:  None Advance to the next day if the specified late start time is before the Created time of the task instance.  Same Day Do not advance day.  Next Day Advance to the next day.  Next Business Day Advance to the next business day.  Next Business Day Advance to the next business day.  Sunday If today is not Sunday, advance to next Sunday.
	<ul> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul>
	Default is – None
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.

of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.  For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 m and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.  Late Finish  If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish		
Late Finish Late Finish Finish Late Finish Finish Late Finish Finish Late Finis		For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration
If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished a specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.  Late Finish Type  Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.		For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Type Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.  Late Finish	Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.
		Options:  • Time - Flag the task if it finishes after the specified time (see Late Finish Time).
		If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.

### Late Finish If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day. Day Constraint Valid values: -- None --Advance to the next day if the specified late finish time is before the Created time of the task instance. Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Nth Day Advance to a specific number of days in the future. Default is - None --. Late Finish Nth Amount If Late Finish Day Constraint = Nth Day; Number of days to advance. Late Finish Duration If Late Finish Type = Duration; Longest amount of time this task instance should take to run. Early Finish If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition. Early Finish Type Required if Early Finish is enabled. Options: Time - Flag the task if it finishes before the specified time (see Early Finish Time). Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.

Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:
	- None Advance to the next day if the specified early finish time is before the Created time of the task instance.  Same Day Do not advance day.  Next Day Advance to the next day.  Next Business Day Advance to the next business day.  Sunday If today is not Sunday, advance to next Sunday.  Monday If today is not Monday, advance to next Monday.  Tuesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Wednesday, advance to next Wednesday.  Thursday If today is not Thursday, advance to next Thursday.  Thursday If today is not Triday, advance to next Thursday.  Friday If today is not Friday, advance to next Friday.  Saturday If today is not Saturday, advance to next Saturday.  Nth Day Advance to a specific number of days in the future.  Default is - None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Critical Path Options	This section contains Critical Path-related specifications for the task.

CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds Minutes Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.
Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.  Options are:  - None No restriction for this task. Run Restriction for when this task will be run. Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held.  If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Restriction can be set to Skip with a Restriction Period of - None -, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.

Restriction	
Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.
	Options are:
	<ul> <li>None –</li> <li>No period of restriction for this task.</li> </ul>
	Before
	Restriction is valid if the date is before the Before Date value.  • After
	Restriction is valid if the date is after the After Date value.  • Span
	Restriction is valid if the date is before the Before Date value and after After Date value.  • On
	Restriction is valid if the date is one of the Date List values.
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for task instances of the task.
First Time	
Ran	System-supplied; date and time this task first ran.
Last Time	Sustant supplied data and time the took lost too
Ran	System-supplied; date and time the task last ran.
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.
Lowest	
Instance Time	System-supplied; shortest amount of time this task has taken to run.

System-supplied; average amount of time this task takes to run.
System-supplied; longest amount of time this task has taken to run.
System-supplied; number of instances in the database for this task.
This section contains Metadata information about this record.
Universally Unique Identifier of this record.
Name of the user that last updated this record.
Date and time that this record was last updated.
Name of the user that created this record.
Date and time that this record was created.
This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Saves a new task record in the Controller database.
Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Saves a new record in the Controller database and continues to display that record.
Displays empty (except for default values) Details for creating a new task.
Saves updates to the record.
Manually launches the task.
Displays a list of any parent Workflow tasks for this task.
Creates a copy of this task, which you are prompted to rename.

### Delete

Deletes the current record.

#### Note

You cannot delete a task if it is either:

- Specified in an enabled Trigger.The only task specified in a disabled Trigger.

Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task.
Tabs	This section identifies the tabs across the top of the Task Details that provide access to additional information about the task.
Advanced Criteria	If the Use Advanced Criteria field is enabled; advanced search criteria to use for Email Monitor filter criteria.
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.

### **Actions**

Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task.

### Events are:

- Task instance status
- Exit codesLate start
- Late finish
- Early finish

#### Actions are:

Abort Action	Abort the task if certain events occur. For details, see Abort Actions.
Email Notification	Send an email if certain events occur. For details, see Email Notification Actions.
Set Variable	Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Workflow.
SNMP Notification	Send an email if certain events occur. For details, see SNMP Notification Actions.
System Operation	Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions.

Virtual Resources	Lists all Virtual Resources to which this task is assigned.
Mutually Exclusive	Lists all tasks that have been set to be mutually exclusive of this task.
Instances	Lists all instances of this task.
Email Monitor Triggers	Lists all Email Monitor triggers that reference this task in the Email Monitor field of the trigger Details; that is, a list of all Email Monitor triggers that execute this task. For instructions on creating triggers, see Triggers.
Triggers	List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current name="" task="">#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers.</current>
Notes	Lists all notes associated with this record.
Versions	Stores copies of all previous versions of the current record. See Record Versioning.

## **Advanced Criteria**

## **Advanced Criteria Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the Advanced Criteria Details of an Email Monitor Task.

Field Name	Description
From Filter	Type of From filter condition to apply.  Options:      None (default)     Equals     Contains     Does Not Equal     Does Not Contain     Regex
Reply-To Filter	Type of Reply-To filter condition to apply.  Options:
To Filter	Type of To filter condition to apply.  Options:

Cc Filter	Type of Cc filter condition to apply.  Options:
Subject Filter	Type of Subject filter condition to apply.  Options:
Body Filter	Type of Body filter condition to apply.  Options:

Case Sensitive	If enabled, text-based filters should be treated as case-sensitive.
Filter Logic	Logic to apply when combining filters.

# **Viewing an Email Monitor Task Instance**

When an Email Monitor task is launched, the Controller creates a task instance record of that task.

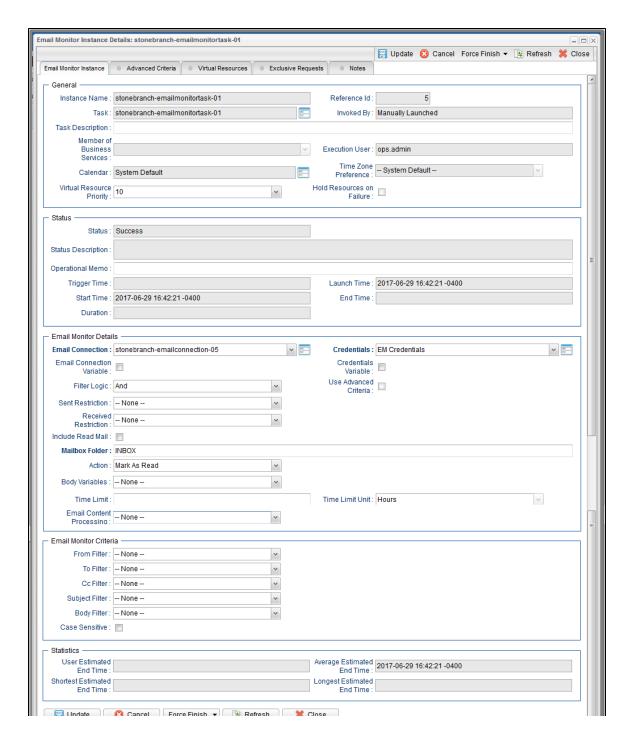

A task instance contains detailed information about a single execution of that task.

You can access a task instance from:

- Instances tab on the Email Monitor Task Details for that task
- Activity MonitorTask Instances list

## **Email Monitor Task Instance Details**

The following Email Monitor Task Instance Details contains information on the execution of the task shown in the Email Monitor Task Details.

# **Email Monitor Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in Email Monitor Task Instance Details.

Field Name	Description
General	This section contains general information about the task instance.
{anchor:Instance Name}}Instance Name	Name of this task instance.
Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.
Invoked by	System-supplied; how the task instance was launched.  Options:  Trigger: (Trigger Name)     Instance was launched by the named trigger.  Workflow: (Workflow Name)     Instance was launched by the named workflow.  Manually Launched     Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.

Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.
	Options:
	<ul> <li>System Default –         Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxxx)</li> </ul>
	Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.
	<ul> <li>Inherited         Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.     </li> </ul>
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.
	Options: 1 (high) - 20 (low).
	Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.
Evaluation Time	If time zone of user is different than time zone of task instance; Time at which Execution Restrictions and Run Criteria were evaluated based upon the requested time zone. (Time zone of task instance displays in parentheses.)
Critical	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.

Queued Time	System-supplied; Date and time the task was queued for processing.	
Trigger Time	System-supplied; Date and time the task instance was triggered.	
Launch Time	System-supplied; Date and time the task instance was launched.	
Start Time	System-supplied; Date and time the task instance started.	
End Time	System-supplied; Date and time the task instance completed.	
Duration	System-supplied; amount of time the task instance took to run.	
Email Monitor Details	This section contains assorted detailed information about the task.	
Email Connection	Required; Name of an incoming Email Connection (Type = Incoming). An Email Connection specifies information about an outgoing or incoming email server. Enter the name of an existing incoming Email Connection, select an existing incoming Email Connection from the drop-down list, or clear the Email Connection field and click the Details icon to create a new Email Connection (Incoming will be pre-selected in the Type field).	
Email Connection Variable	Indication of whether the Email Connection field is a reference field for selecting a specific Email Connection (unchecked) or a text field for specifying the Email Connection as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.	
	Note When updating multiple Tasks, to change from using an Email Connection reference to using an Email Connection variable, you must change the Email Connection Variable field to Yes and specify the Email Connection variable in the Email Connection Unresolved field. Conversely, to change from using an Email Connection variable to using an Email Connection reference, you must change the Email Connection Variable field to No and specify the Email Connection reference in the Email Connection field.	
Credentials	Credentials to be used to connect to the Email server.	

# Credentials Variable Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions. Note When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the Credentials Variable field to Yes and specify the Credentials variable in the Credentials Unresolved field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the Credentials Variable field to No and specify the Credentials reference in the Credentials field. Filter Logic Logic to apply when combining filters. If Use Advanced Criteria is enabled, it is the logic to apply when combining Advanced Criteria records. Options: And (default) • Or Use Advanced If enabled, use advanced criteria specified under the Advanced Criteria tab for the Email Monitor filter criteria. Criteria Sent Restriction Type of Sent restriction to apply. Options: • -- None -- (default) On Before After Span Sent On If Sent Restriction = On; Sent On restriction value. Options: Date (default) Today Yesterday Tomorrow Sent On Date If Sent On = Date; Specific date for the Sent On restriction value.

Sent Before	If Sent Restriction = Before; Sent Before restriction value.
	Options:
	<ul> <li>Date (default)</li> <li>Today</li> <li>Yesterday</li> <li>Tomorrow</li> <li>Launch Time</li> <li>Relative</li> </ul>
	Relative
Sent Before Date	If Sent Before = Date; Specific date for the Sent Before restriction value.
Sent Before Offset	If Sent Before = Relative; Offset, relative to the last launch time, for the Sent Before restriction value. Format: [+/-]hh:mm
Sent After	If Sent Restriction = After; Sent After restriction value.
	Options:
	<ul> <li>Date (default)</li> <li>Today</li> <li>Yesterday</li> <li>Tomorrow</li> <li>Launch Time</li> <li>Relative</li> </ul>
Sent After Date	If Sent After = Date; Specific date for the Sent After restriction value.
Sent After Offset	If Sent After = Relative; Offset, relative to the last launch time, for the Sent After restriction value.
Received Restriction	Type of Received restriction to apply.
	Options:
	<ul> <li> None (default)</li> <li>On</li> <li>Before</li> <li>After</li> <li>Span</li> </ul>

If Received Restriction = On; Received On restriction value.
Options:
<ul> <li>Date (default)</li> <li>Today</li> <li>Yesterday</li> <li>Tomorrow</li> </ul>
If Received On = Date; Specific date for the Received On restriction value.
If Received Restriction = Before; Received Before restriction value.
Options:
<ul> <li>Date (default)</li> <li>Today</li> <li>Yesterday</li> <li>Tomorrow</li> <li>Relative</li> </ul>
If Received Before = Date; Specific date for the Received Before restriction value.
If Received Before = Relative; Offset, relative to the last launch time, for the Received Before restriction value. Format: [+/-]hh:mm
If Received Restriction = After; Received After restriction value.
Options:
<ul> <li>Date (default)</li> <li>Today</li> <li>Yesterday</li> <li>Tomorrow</li> <li>Relative</li> </ul>
If Received After = Date; Specific date for the Received After restriction value.
If Received After = Relative; Offset, relative to the last launch time, for the Received After restriction value.

Include Read Mail	If enabled, specifies that mail marked as read should be included by the filter.
Mailbox Folder	Mailbox folder to monitor on the server specified in the selected Email Connection.
Action	Action to take on mail that matches the filter.
	Options:  Mark As Read (default) Delete Delete/Mark As Read Move Move/Mark As Read
Body Variables	Specifies whether to parse the Email body for name/value pairs to create variables from.  Options:
	<ul> <li> None No processing of the Email body will occur.</li> <li>Within Body Entire body of the Email will be scanned for a "=" (equal sign) and any lines containing a "=" will be variablized as long as the text to the left of the "=" conforms to the naming standards for variables.</li> <li>Within Default Markers Marker begin and end values are defined by the Email Body Default Begin Marker and Email Body Default End Marker Universal Controller system properties.</li> <li>Within Custom Markers Marker begin and end values are defined in the Begin Marker and End Marker fields.</li> </ul>
	If markers are used, all lines of the Email body between the begin and end markers will be variablized in accordance to java properties. Any lines of the Email body outside the markers will be ignored w/r variablization.
Time Limit	Used for Email Monitor tasks not associated with a trigger; Amount of time (in units specified by Time Limit Unit) to monitor for the Email Monitor conditions to be met. The Time Limit duration is always relative to the start time of the Email Monitor task instance.
Time Limit Unit	Unit of time to use for Time Limit.  Options:  Minutes Hours (default) Days

Email Content Processing	Method for determining the success or failure of this task based on Email content.
	Options:
	<ul> <li> None</li> <li>Success Body Contains</li> <li>Failure Body Contains</li> <li>Success Body Does Not Contain</li> <li>Failure Body Does Not Contain</li> <li>Success Subject Contains</li> <li>Failure Subject Contains</li> <li>Success Subject Does Not Contain</li> <li>Failure Subject Does Not Contain</li> <li>Default is None</li> </ul>
Content Value	Required if Email Content Processing is not None; Content Value to be matched in the email.
Case Sensitive Content	If Email Content Processing is not None; Indication of whether or not matching will be performed in a case sensitive manner.
Email Monitor Criteria	This section contains criteria for selecting emails to monitor.
From Filter	Type of From filter condition to apply.  Options:  None (default) Equals Contains Does Not Equal Does Not Contain Regex
From	If From Filter = any value other than None; From filter condition value.

Options:	eply-To filter condition to apply.  - None (default)  iquals  Octobrains  Oces Not Equal  Oces Not Contain  is Blank  is Not Blank  Regex   To Filter = Equals, Contains, Does Not Equal, Does Not Contain, or Regex; Reply-To filter condition value.
Page   Page	Equals Contains Does Not Equal Does Not Contain S Blank S Not Blank Regex
Eqq   Co   Do   Do   Do   Is Eq   Is N   Reply-To   If Reply-To   To Filter   Type of To   Options:	Equals Contains Does Not Equal Does Not Contain S Blank S Not Blank Regex
To Filter  Type of To Options:	o Filter = Equals, Contains, Does Not Equal, Does Not Contain, or Regex; Reply-To filter condition value.
Type of To Options:	
- Eq' - Co - Do - Do - Is E - Is N - Re  To  If To Filter =  Cc Filter  Type of Cc Options:   - Eq' - Co	o filter condition to apply.
Eq.     Co     Do     Do     Is E     Is N     Re	
To If To Filter =  Cc Filter  Type of Cc Options:    Eq  - Co	- None (default)  iquals  contains  ones Not Equal  ones Not Contain  s Blank  s Not Blank
Cc Filter =  Type of Cc Options:  Eqi - Co	
Type of Cc Options:  • • Eq: • Co	r = Equals, Contains, Does Not Equal, Does Not Contain, or Regex; To filter condition value.
• • Eqi • Co	c filter condition to apply.
• Do • Is E	- None (default) Equals Contains Joes Not Equal Does Not Contain S Blank S Not Blank Regex
Cc If Cc Filter =	

Subject Filter	Type of Subject filter condition to apply.
	Options:
	<ul> <li> None (default)</li> <li>Equals</li> <li>Starts With</li> <li>Contains</li> <li>Ends With</li> <li>Does Not Equal</li> <li>Does Not Start With</li> <li>Does Not Contain</li> <li>Does Not End With</li> <li>Is Blank</li> <li>Is Not Blank</li> <li>Regex</li> </ul>
Subject	If Subject Filter = anything other than None, Is Blank, or Is Not Blank; Subject filter condition value.
Body Filter	Type of Body filter condition to apply.  Options:
	<ul> <li> None (default)</li> <li>Equals</li> <li>Starts With</li> <li>Contains</li> <li>Ends With</li> <li>Does Not Equal</li> <li>Does Not Start With</li> <li>Does Not Contain</li> <li>Does Not End With</li> <li>Is Blank</li> <li>Is Not Blank</li> <li>Regex</li> </ul>
Body	If Body Filter = anything other than None, Is Blank, or Is Not Blank; Body filter condition value.  Note If an email being monitored does not contain the body in plain text, but only in HTML format, a plain text body will be generated from the HTML body content.
Case Sensitive	If enabled, text-based filters should be treated as case-sensitive.

Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	Amount of time to wait before starting a task from the time that it was launched.  Options are:  - None -  Time Relative Time Duration Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.
Wait Day Constraint	If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day.    Valid values:   None
	Default is – None

Wait Duration	If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task.
Wait Duration In Seconds	If Wait To Start = Seconds; Number of seconds to wait before starting the task.
Delay On Start	Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified.
	Options are:
	<ul> <li>None –</li> <li>Duration</li> <li>Seconds</li> </ul>
Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Time Options	This section contains time-related specifications for the task instance.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start Type	Required if Late Start is enabled.
	Options:
	<ul> <li>Time - Flag the task if it starts after the specified time.</li> <li>Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.</li> </ul>
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

Late Start Day	
Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.
	Valid values:
	• None
	Advance to the next day if the specified late start time is before the Created time of the task instance.  • Same Day
	Do not advance day.  • Next Day
	Advance to the next day.
	Next Business Day     Advance to the next business day.
	Sunday     If today is not Sunday, advance to next Sunday.
	• Monday
	If today is not Monday, advance to next Monday.  • Tuesday
	If today is not Tuesday, advance to next Tuesday.  • Wednesday
	If today is not Wednesday, advance to next Wednesday.
	Thursday     If today is not Thursday, advance to next Thursday.
	Friday     If today is not Friday, advance to next Friday.
	Saturday
	If today is not Saturday, advance to next Saturday.  • Nth Day
	Advance to a specific number of days in the future.
	Default is – None
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.
Duration	
	For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.
	For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:  Time - Flag the task if it finishes after the specified time (see Late Finish Time).  Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:  • None     Advance to the next day if the specified late finish time is before the Created time of the task instance.  • Same Day     Do not advance day.  • Next Day     Advance to the next day.  • Next Business Day     Advance to the next business day.  • Sunday     If today is not Sunday, advance to next Sunday.  • Monday     If today is not Monday, advance to next Monday.  • Tuesday     If today is not Tuesday, advance to next Wednesday.  • Thursday     If today is not Thursday, advance to next Wednesday.  • Thursday     If today is not Thursday, advance to next Thursday.  • Friday     If today is not Friday, advance to next Friday.  • Saturday     If today is not Saturday, advance to next Saturday.  • Nth Day     Advance to a specific number of days in the future.  Default is - None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early Finish Day	
Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.
	Valid values:
	<ul> <li> None Advance to the next day if the specified early finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> </ul>
	<ul> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul>
	Default is – None
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration	this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to

## **CP** Duration (Resolved) Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions. **CP** Duration Unit Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select **Minutes** in this field. Options: Seconds Minutes Hours Default is Minutes. Workflow This section contains Execution Restriction specifications for the task if it is within a Workflow. Execution **Options** Execution Restriction Specification for whether or not there is a restriction for this task to be run, skipped, or held. Options are: -- None -- No restriction for this task. Run Restriction for when this task will be run. • Skip Restriction for when this task will be skipped. Hold Restriction for when this task will be held. If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow. Restriction Period If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted. Options are: None – No period of restriction for this task. Before Restriction is valid if the date is before the Before Date value. Restriction is valid if the date is after the After Date value. Span Restriction is valid if the date is before the Before Date value and after After Date value. • On Restriction is valid if the date is one of the Date List values.

Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instance.
User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Status History	History of all statuses that the task instance has gone through.
Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.

Update	Saves updates to the record.
Force Finish	See Force Finishing a Task.
Hold	Places the task instance on Hold (see Putting a Task on Hold).
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.
Re-run	See Re-running a Task.
View Parent	Displays the task instance Details for the parent Workflow of this task instance.
Delete	Deletes the current record.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task instance.
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.
Advanced Criteria	If the Use Advanced Criteria field is enabled; advanced search criteria to use for Email Monitor filter criteria.
Virtual Resources	Lists all Virtual Resources to which this task is assigned.
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.
Notes	Lists all notes associated with this record.

# **Running an Email Monitor Task**

You can run an Email Monitor task:

• Manually, by clicking the Launch Task or Launch Task with Variables button in the Email Monitor Tasks list or Email Monitor Task Details Action menu.

- As part of a workflow.Specify triggers that run the task automatically based on times or events.

# **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

## **Web Service Task**

- Overview
- SSL Secured HTTPS
- Built-In Variables
- Creating a Web Service Task
  - Web Service Task Details
  - Web Service Task Details Field Descriptions
- Viewing a Web Service Task Instance
  - Web Service Task Instance Details
  - Web Service Task Instance Details Field Descriptions
- Running a Web Service Task
- Monitoring Task Execution

### Overview

The Web Service Task allows you to invoke a Web Service running on any application server.

### **SSL Secured HTTPS**

Web Service Tasks support the use of https:// instead of the non-encrypted http:// for the Web Service Task URL.

This requires setting up a truststore (keystore) and setting the following properties in the Universal Controller Start-up Properties (opswise.properties) file:

- opswise.trustmanager.truststore
- opswise.trustmanager.truststore.password

You must make sure that the HTTPS server's certificate (or root certificate) exists in the truststore that is referenced by these two properties. This is required to validate the remote web service providers identity. Universal Controller does not provide an option to bypass https certificate validation.

The hostname in your URL is verified against the certificate and must match the certificate's CN (Common Name) or SAN (Subject Alternative Name).

## **Built-In Variables**

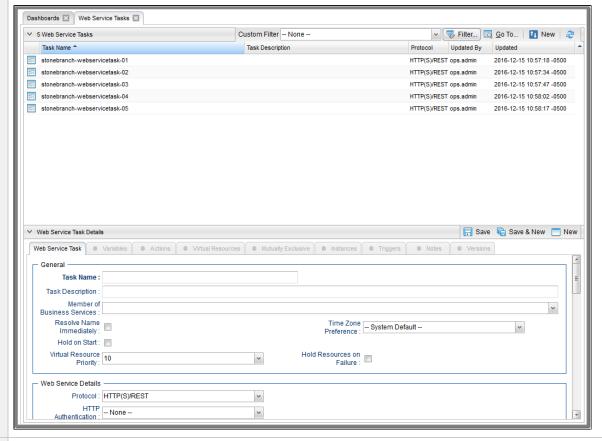

The following built-in variables can be used in a Web Service task to pass data where appropriate:

- Task Instance variables
- Web Service Task Instance variables

# **Creating a Web Service Task**

From the Automation Center navigation pane, select **Tasks > Web Service Tasks**. The Web Service Tasks list displays a list of all currently defined Web Service tasks.

Below the list, Web Service Task Details for a new Web Service task displays.

- Step 2 Enter/select Details for a new Web Service task, using the field descriptions below as a guide.
  - Required fields display in **boldface**.
  - Default values for fields, if available, display automatically.

To display more of the Details fields on the screen, you can either:

- · Use the scroll bar.
- Temporarily hide the list above the Details.
- Click the **New** button above the list to display a pop-up version of the Details.

Step 3 Click a Save button. The task is added to the database, and all buttons and tabs in the Task Details are enabled.

#### Note

To open an existing record on the list, either:

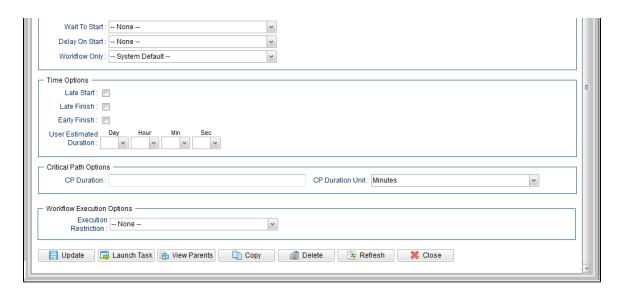

- Click a record in the list to display its record Details below the list. (To clear record Details below the list, click the New button that displays above and below the Details.)
- Clicking the Details icon next to a record name in the list, or right-click a record in the list and then click **Open** in the Action menu that displays, to display a pop-up version of the record Details.
- Right-click a record in the a list, or open a record and right-click in the record Details, and then click **Open In Tab** in the Action menu that displays, to display the record Details under a new tab on the record list page (see Record Details as Tabs).

### **Web Service Task Details**

The following Web Service Task Details is for an existing Web Service task.

Depending on the values that you enter / select for these fields, and whether or not the Web Service task has ever been launched, more (or less) fields may display. See the field descriptions, below, for a description of all fields that may display in the Web Service Task Details.

## **Web Service Task Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in the Web Service Task Details.

Field Name	Description
General	This section contains general information about the task.
Task Name	User-defined name of this task (Maximum = 255 alphanumeric characters); variables supported. It is the responsibility of the user to develop a workable naming scheme for tasks.
Version	System-supplied; version number of the current record, which is incremented by the Controller every time a user updates a record. Click the Versions tab to view previous versions. For details, see Record Versioning.
Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Resolve Name Immediately	If enabled, the Instance Name of the task instance will be resolved immediately at trigger/launch time.

Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.
	Options:
	<ul> <li>System Default –         Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited.</li> <li>Server (xxxx)</li> </ul>
	<ul> <li>Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server.</li> <li>Inherited         Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.     </li> </ul>
Hold on Start	If enabled, when the task is launched it appears in the Activity Monitor with a status of <b>Held</b> . The task runs when the user releases it.
Hold Reason	Information about why the task will be put on hold when it starts.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).
	Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Web Service Details	This section contains assorted detailed information about the task.
Protocol	Protocol to use for the operation.
	Options:
	<ul><li>HTTP(S)/REST</li><li>SOAP</li></ul>
	Default is HTTP(S)/REST.

HTTP Authentication	HTTP authentication scheme to use.
	Options:
	• None • Basic
	Default is None
Credentials	If HTTP Authentication = Basic; Credentials used when invoking the Web Service.
Credentials Variable	If HTTP Authentication = Basic; Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the Credentials Variable field to Yes and specify the Credentials variable in the Credentials Unresolved field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the Credentials Variable field to No and specify the Credentials reference in the Credentials field.
HTTP Version	Version of the HTTP protocol to use.
	Options:
	<ul><li>1.0</li><li>1.1</li></ul>
	Default is 1.1.
HTTP Method	If Protocol = HTTP(S)/REST; Type of HTTP request method to use.
	Options:
	• GET • POST
	<ul> <li>PUT</li> <li>PATCH</li> <li>DELETE</li> </ul>
	Default is POST.

SOAP	
Version	If Protocol = SOAP; Version of the SOAP protocol to use.
	Options:
	• 1.1
	• 1.2
	Default is 1.2.
Timeout	
	Number of seconds to wait for the request to complete.
	If no value is specified, the value defaults to the Web Service Task Timeout Universal Controller property value.
URL	
	URL of the target service, excluding query parameters.
	Optionally, you can include query parameters directly on the URL; however, the query string must be properly URL-encoded. In other words, the URL must be valid. For specifying unencoded query parameters, use URL Query Parameters.
	Note The Web Service Task URL Whitelist Regular Expression Universal Controller system property specifies which URLs are supported by the Web Service task. (The default allows all URLs to be supported.)  If a task instance attempts to run, but this URL does not match a URL specified by Web Service Task URL Whitelist Regular Expression, the task instance transitions to a Start Failure with an appropriate Status Description.
	transitions to a Start I allule with an appropriate Status Description.
URL Query Parameters	Any query parameters to be encoded as a query string and appended to the URL.
HTTP	
Payload Type	If Protocol = HTTP(S)/REST and HTTP Method = POST, PUT, or PATCH; Type of HTTP payload.
	Options:
	<ul><li>Raw</li><li>Form Data</li></ul>
	Default is Raw.

MIME Type If Protocol = HTTP(S)/REST; MIME type of the message body. Options: application/javascript application/json application/xml text/html text/plain text/xml • Other... No default. If HTTP Payload Type = Form Data, MIME Type is automatically assigned a value of application/x-www-form-urlencoded and becomes read only. Form Data If HTTP Payload Type = Form Data; Any parameters to be encoded and added to the message body. SOAP Payload Type If Protocol = SOAP; Type of SOAP payload. Options: Body Envelope Default is Body. SOAP Action If Protocol = SOAP; Value of: • SOAPAction HTTP Header field in SOAP 1.1 • action parameter in SOAP 1.2 Payload If HTTP Payload Type = Raw; Specification for whether the payload is defined directly in this form (task Details) or if it is a reference to a script that contains the content of the Source request payload. Options: Form Script Default is Form.

Payload	If Payload Source = Form; Request payload.
HTTP Headers	HTTP headers
SOAP Response Output	If Protocol = SOAP; Element of the SOAP response to be captured as output.  Options:  Body/First Element Body Envelope  Default is Body/First Element.
Response Processing	Specification for how to process the response in order to determine success or failure.  Options:  Default Success Status Code Range Success Status Code Range Failure Status Code Range Success Output Contains Failure Output Contains Default is Default Success Status Code Range.
Status Codes	If Response Processing = Success Status Code Range or Failure Status Code Range; Qualifying status codes. Format: 200-299,503.
Output Type	If Response Processing = Success Output Contains or Failure Output Contains; Output type that the Response Processing mechanism should assume when evaluating the output. If the expected output is XML or JSON, it is valid to specify Text. However, when specifying XML or JSON, the output must be XML or JSON, respectively; otherwise, the parsing will fail and the path expression evaluation will return no matches.  Options:  Text  XML  JSON  Default is Text.

Doth	
Path Expression	XPath Expression (if Output Type = XML) or JSON Path Expression (if Output Type = JSON) to be used when evaluating the response output.
	Refer to https://www.w3schools.com/xml/xpath_intro.asp and https://github.com/json-path/JsonPath respectively for more details.
Strategy	If Output Type = XML or JSON; Strategy to take when applying the condition Operator and Value against the Path Expression matches.
	Options:
	<ul> <li>Match Any</li> <li>Match All</li> <li>Match None</li> <li>Count</li> </ul>
	Default is Match Any.
Operator	If Response Processing = Success Output Contains or Failure Output Contains; Condition operator to evaluate in combination with the specified condition Value.
	Options:
	• = • !=
	• > • >=
	• <
	• <= • regex
	Default is =.
Value	If Response Processing = Success Output Contains or Failure Output Contains; Condition value to evaluate in combination with the specified condition Operator.
Auto Cleanup	Specification for whether or not to enable the auto clean-up of Web Service response output upon task instance completion or, if the task instance is within a workflow, when the top-level workflow instance completes.
Retry Options	This section contains specifications for retrying the task.
Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retry Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.

User-defined; number of seconds between each retry.
User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:
<ul> <li>All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.</li> </ul>
<ul> <li>Workflow conditional path processing; any Successors waiting on a failure path will not be released.</li> </ul>
• Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which <b>Suppress Intermediate Failures</b> has been enabled.
Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
This section contains specifications for waiting to start and/or delaying on start the task.
Amount of time to wait before starting a task from the time that it was launched.
Options are:
<ul> <li>None –</li> <li>Time</li> <li>Relative Time</li> <li>Duration</li> <li>Seconds</li> </ul>
If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

#### Wait Day Constraint If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day. Valid values: -- None --• If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. Same Day Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Default is - None --. Wait Duration If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task. Wait Duration In Seconds If Wait To Start = Seconds; Number of seconds to wait before starting the task. Delay On Start Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified. Options are: None – Duration Seconds

Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Workflow Only	Specification for whether or not to apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  Options are:  System Default     Apply the Wait To Start and Delay On Start specifications as defined by the System Default Wait/Delay Workflow Only system property. (Default is yes.)  Yes     Apply the Wait To Start and Delay On Start specifications only if the task is in a Workflow.  No     Apply the Wait To Start and Delay On Start specifications whether or not the task is in a Workflow.
Time Options	This section contains time-related specifications for task instances of the task.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

Late Start Day Constraint	If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.  Valid values:  • None Advance to the next day if the specified late start time is before the Created time of the task instance.  • Same Day Do not advance day.  • Next Day Advance to the next day.  • Next Business Day Advance to the next business day.  • Sunday If today is not Sunday, advance to next Sunday.  • Monday If today is not Monday, advance to next Monday.  • Tuesday
	If today is not Tuesday, advance to next Tuesday.  • Wednesday If today is not Wednesday, advance to next Wednesday.  • Thursday If today is not Thursday, advance to next Thursday.  • Friday If today is not Friday, advance to next Friday.  • Saturday If today is not Saturday, advance to next Saturday.
	Nth Day Advance to a specific number of days in the future.  Default is – None
Late Start Nth Amount	If Late Start Day Constraint = Nth Day; Number of days to advance.
Late Start Duration	If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.  For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.  For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
Late Finish	If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Late Finish Type	Required if Late Finish is enabled.
	Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:
	<ul> <li> None</li> <li>Advance to the next day if the specified late finish time is before the Created time of the task instance.</li> </ul>
	Same Day     Do not advance day.
	Next Day
	Advance to the next day.  • Next Business Day
	Advance to the next business day.
	Sunday     If today is not Sunday, advance to next Sunday.
	Monday     If today is not Monday, advance to next Monday.
	• Tuesday
	If today is not Tuesday, advance to next Tuesday.  • Wednesday
	If today is not Wednesday, advance to next Wednesday.
	Thursday     If today is not Thursday, advance to next Thursday.
	Friday If today is not Friday, advance to next Friday.
	Saturday
	If today is not Saturday, advance to next Saturday.  • Nth Day
	Advance to a specific number of days in the future.
	Default is – None
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.
Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.

Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Early Finish Type	Required if Early Finish is enabled.  Options:  Time - Flag the task if it finishes before the specified time (see Early Finish Time).  Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.
Early Finish Day Constraint	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.  Valid values:  - None Advance to the next day if the specified early finish time is before the Created time of the task instance Same Day Do not advance day Next Day Advance to the next day Next Business Day Advance to the next business day Sunday If today is not Sunday, advance to next Sunday Monday If today is not Monday, advance to next Monday Tuesday If today is not Tuesday, advance to next Wednesday Wednesday If today is not Tuesday, advance to next Wednesday Thursday If today is not Friday, advance to next Thursday Friday If today is not Friday, advance to next Friday Saturday If today is not Friday, advance to next Friday Saturday If today is not Saturday, advance to next Saturday Nit Day Advance to a specific number of days in the future.  Default is - None

Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
Early Finish Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
User Estimated Duration	Estimated amount of time it should normally take to run this task. The Controller uses this information to calculate the User Estimated End Time on a task instance record.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.  Options:  Seconds Minutes Hours  Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.

Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.
restriction	Options are:
	<ul> <li> None No restriction for this task.</li> <li>Run Restriction for when this task will be run.</li> <li>Skip Restriction for when this task will be skipped.</li> <li>Hold Restriction for when this task will be held.</li> </ul>
	If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.
Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.
	Options are:
	<ul> <li>None – No period of restriction for this task.</li> <li>Before Restriction is valid if the date is before Date value.</li> <li>After</li> </ul>
	Restriction is valid if the date is after the After Date value.  Span Restriction is valid if the date is before the Before Date value and after After Date value.  On Restriction is valid if the date is one of the Date List values.
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for task instances of the task.

First Time Ran	System-supplied; date and time this task first ran.
Last Time Ran	System-supplied; date and time the task last ran.
Last Instance Duration	System-supplied; amount of time the task took to run the last time it ran.
Lowest Instance Time	System-supplied; shortest amount of time this task has taken to run.
Average Instance Time	System-supplied; average amount of time this task takes to run.
Highest Instance Time	System-supplied; longest amount of time this task has taken to run.
Number of Instances	System-supplied; number of instances in the database for this task.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Buttons	This section identifies the buttons displayed above and below the Task Details that let you perform various actions.
Save	Saves a new task record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new task.
Update	Saves updates to the record.
Launch Task	Manually launches the task.

View Parents	Displays a list of any parent Workflow tasks for this task.
Сору	Creates a copy of this task, which you are prompted to rename.
Delete	Deletes the current record.
	<ul> <li>Note         You cannot delete a task if it is either:         <ul> <li>Specified in an enabled Trigger.</li> <li>The only task specified in a disabled Trigger.</li> </ul> </li> </ul>
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task.
Tabs	This section identifies the tabs across the top of the Task Details that provide access to additional information about the task.
Variables	Lists all user-defined variables associated with this record; that is, variables that have been defined for this specific record.

### Actions Allows you to specify actions that the Controller will take automatically based on events that occur during the execution of this task. Events are: Task instance status Exit codes Late start Late finish Early finish Actions are: Abort the task if certain events occur. For details, see Abort Actions. **Abort Action** Send an email if certain events occur. For details, see Email Notification Actions. **Email** Notification Used in tasks and workflows to set a variable based on the occurrence of certain events. For details, see Creating a Set Variable Action within a Task or Set Variable Workflow. **SNMP** Send an email if certain events occur. For details, see SNMP Notification Actions. **Notification** Run an Universal Controller system operation based on specified conditions. For details, see System Operation Actions. System Operation Virtual Lists all Virtual Resources to which this task is assigned. Resources Mutually Lists all tasks that have been set to be mutually exclusive of this task. **Exclusive** Lists all instances of this task. Instances **Task Monitor Triggers** Lists all Task Monitor triggers that reference this task in the Task Monitor field of the trigger Details; that is, a list of all Task Monitor triggers that execute this task. For instructions on creating triggers, see Triggers. Triggers List of all triggers that reference this task in the Task(s) field of the trigger Details; that is, a list of all triggers that have been defined to launch this task. Also allows you to add new triggers. If you add a new trigger from this location, the Controller automatically constructs a default trigger name as follows: <current task name>#TRIGGER#. You can change the default name if desired. For instructions on creating triggers, see Triggers. Notes Lists all notes associated with this record.

Versions	Stores copies of all previous versions of the current record. See Record Versioning.

### **Viewing a Web Service Task Instance**

When a Web Service task is launched, the Controller creates a task instance record of that task.

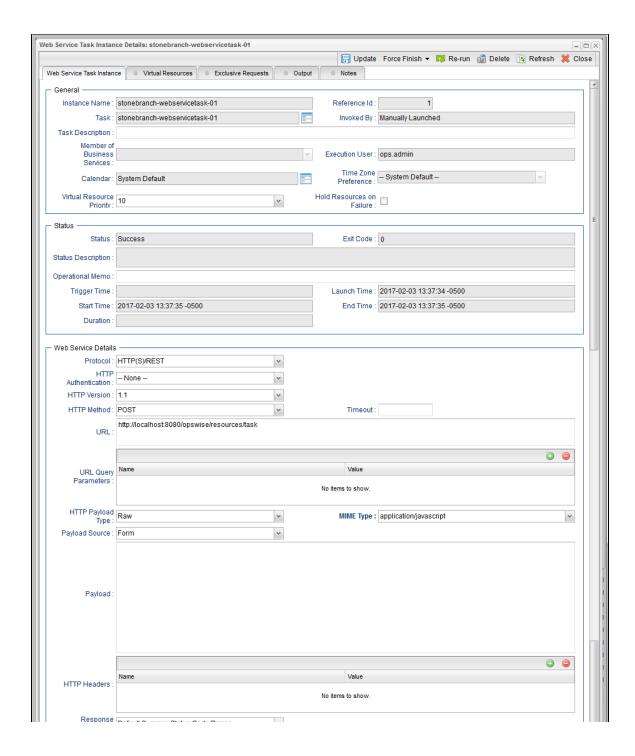

A task instance contains detailed information about a single execution of that task.

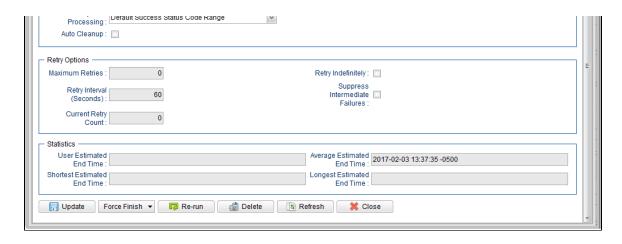

You can access a task instance from:

- Instances tab on the Web Service Task Details for that task
- Activity Monitor
- Task Instances list

#### **Web Service Task Instance Details**

The following Web Service Task Instance Details contains information on the execution of the task shown in the Web Service Task Details.

### **Web Service Task Instance Details Field Descriptions**

The following table describes the fields, buttons, and tabs that display in Web Service Task Instance Details.

Field Name	Description
General	This section contains general information about the task instance.
Instance Name	Name of this task instance.
Reference Id	System-supplied; the Controller increments this number each time the task is run.
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.
Invoked by	System-supplied; how the task instance was launched.  Options:  Trigger: (Trigger Name) Instance was launched by the named trigger.  Workflow: (Workflow Name) Instance was launched by the named workflow.  Manually Launched Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.

Task Description	Description of this record. (Maximum = 200 characters.)
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.
Execution User	System-supplied; If the task was launched manually; ID of the user who launched it.
Calendar	Calendar associated with the task instance.
Time Zone Preference	User-defined; allows you to specify the time zone that will be applied to the task.  Options:  - System Default – Time zone is based on the value of the Task Timezone Preference Universal Controller system property: Server or Inherited. Server (xxx) Where (xxx) is the time zone ID of the server; time zone is evaluated in the time zone of the server. Inherited Time zone is evaluated in the time zone of the Parent Workflow or Trigger / Launch specification in the case there is no Parent Workflow.
Virtual Resource Priority	Priority for acquiring a resource when two or more tasks are waiting for the resource. This priority applies to all resources required by the task.  Options: 1 (high) - 20 (low).  Default is 10.
Hold Resources on Failure	If enabled, the task instance will continue to hold Renewable resources if the task instance fails. Renewable resources will be returned only if the task instance status is either Complete, Finished, or Skipped.
Status	This section contains information about the current status of the task instance.
Status	System-supplied; see Task Instance Statuses.
Status Description	System-supplied; additional information, if any, about the status of the task instance.
Operational Memo	User-defined operational memo.

	(Time zone of task instance displays in parentheses.)
Critical I	Indicates that this task is in the Critical Path of a workflow.
Wait Until Time	Amount of time calculated to wait before the task was started, based on Wait To Start and Delay On Start times.
Queued Time	System-supplied; Date and time the task was queued for processing.
Trigger Time	System-supplied; Date and time the task instance was triggered.
Launch Time	System-supplied; Date and time the task instance was launched.
Start Time	System-supplied; Date and time the task instance started.
End Time	System-supplied; Date and time the task instance completed.
Duration	System-supplied; amount of time the task instance took to run.
Trigger	Trigger, if any, on whose behalf the Task Monitor task is monitoring other tasks.
Task Instance I Matched	Last task that matched the specifications of the task(s) being monitored.
Web Service Details	This section contains assorted detailed information about the task instance.
Protocol I	Protocol to use for the operation.
(	Options:
	<ul><li>HTTP(S)/REST</li><li>SOAP</li></ul>
	Default is HTTP(S)/REST.

HTTP	HTTP authentication scheme to use.
Authentication	Options:
	• None • Basic
	Default is None
Credentials	If HTTP Authentication = Basic; Credentials used when invoking the Web Service.
Credentials Variable	If HTTP Authentication = Basic; Indication of whether the Credentials field is a reference field for selecting a specific Credential (unchecked) or a text field for specifying the Credential as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
	Note When updating multiple Tasks, to change from using a Credentials reference to using a Credentials variable, you must change the Credentials Variable field to Yes and specify the Credentials variable in the Credentials Unresolved field. Conversely, to change from using a Credentials variable to using a Credentials reference, you must change the Credentials Variable field to No and specify the Credentials reference in the Credentials field.
HTTP Version	Version of the HTTP protocol to use.
	Options:
	<ul><li>1.0</li><li>1.1</li></ul>
	Default is 1.1.
HTTP Method	If Protocol = HTTP(S)/REST; Type of HTTP request method to use.
	Options:
	• GET • POST
	• PUT • PATCH
	• DELETE
	Default is POST.
Form Data	If HTTP Payload Type = Form Data; Any parameters to be encoded and added to the message body.

SOAP Version	If Protocol = SOAP; Version of the SOAP protocol to use.  Options:  1.1 1.2  Default is 1.2.
Timeout	Number of seconds to wait for the request to complete.  If no value is specified, the value defaults to the Web Service Task Timeout Universal Controller property value.
URL	URL of the target service, excluding query parameters.  Optionally, you can include query parameters directly on the URL; however, the query string must be properly URL-encoded. In other words, the URL must be valid. For specifying unencoded query parameters, use URL Query Parameters.  Note The Web Service Task URL Whitelist Regular Expression Universal Controller system property specifies which URLs are supported by the Web Service task. (The default allows all URLs to be supported.)  If a task instance attempts to run, but this URL does not match a URL specified by Web Service Task URL Whitelist Regular Expression, the task instance transitions to a Start Failure with an appropriate Status Description.
URL Query Parameters	Any query parameters to be encoded as a query string and appended to the URL.
HTTP Payload Type	If Protocol = HTTP(S)/REST; Type of HTTP payload.  Options:  Raw Form Data  Default is Raw.

MIME Type	MIME type of the message body.
	Options:
	<ul> <li>application/javascript</li> <li>application/json</li> <li>application/xml</li> <li>text/html</li> <li>text/plain</li> <li>text/xml</li> <li>Other</li> </ul> No default.
	Note If HTTP Payload Type = Form Data, MIME Type is automatically assigned a value of application/x-www-form-urlencoded and becomes read only.
SOAP Payload Type	If Protocol = SOAP; Type of SOAP payload.
1 ayload 1 ypc	Options:
	Body
	• Envelope
	Default is Body.
SOAP Action	If Protocol = SOAP; Value of:
	<ul> <li>SOAPAction HTTP Header field in SOAP 1.1</li> <li>action parameter in SOAP 1.2</li> </ul>
Payload Source	If HTTP Payload Type = Raw; Specification for whether the payload is defined directly in this form (task Details) or if it is a reference to a script that contains the content of the request payload.
	Options:
	<ul><li>Form</li><li>Script</li></ul>
	Default is Form.
Payload	If HTTP Payload Type = Raw; Request payload.
Payload Script	If Payload Source = Script; Reference to a web service payload script that contains the content of the request payload.

HTTP Headers	HTTP headers
SOAP Response Output	If Protocol = SOAP; Element of the SOAP response to be captured as output.  Options:  Body/First Element Body Envelope  Default is Body/First Element.
Response Processing	Specification for how to process the response in order to determine success or failure.  Options:  Default Success Status Code Range Success Status Code Range Failure Status Code Range Success Output Contains Failure Output Contains  Default is Default Success Status Code Range.
Status Codes	If Response Processing = Success Status Code Range or Failure Status Code Range; Qualifying status codes. Format: 200-299,503.
Output Type	If Response Processing = Success Output Contains or Failure Output Contains; Output type that the Response Processing mechanism should assume when evaluating the output. If the expected output is XML or JSON, it is valid to specify Text. However, when specifying XML or JSON, the output must be XML or JSON, respectively; otherwise, the parsing will fail and the path expression evaluation will return no matches.  Options:  • Text • XML • JSON  Default is Text.
Path Expression	XPath Expression (if Output Type = XML) or JSON Path Expression (if Output Type = JSON) to be used when evaluating the response output.

Strategy	If Output Type = XML or JSON; Strategy to take when applying the condition Operator and Value against the Path Expression matches.
	Options:
	<ul> <li>Match Any</li> <li>Match All</li> <li>Match None</li> <li>Count</li> </ul>
	Default is Match Any.
Operator	If Response Processing = Success Output Contains or Failure Output Contains; Condition operator to evaluate in combination with the specified condition Value.
	Options:
	• =
	• != • >
	• > • >=
	• <
	• <=
	• regex
	Default is =.
Value	If Response Processing = Success Output Contains or Failure Output Contains; Condition value to evaluate in combination with the specified condition Operator.
Auto Cleanup	Specification for whether or not to enable the auto clean-up of Web Service response output upon task instance completion or, if the task instance is within a workflow, when the top-level workflow instance completes.
Wait / Delay Options	This section contains specifications for waiting to start and/or delaying on start the task.
Wait To Start	
	Amount of time to wait before starting a task from the time that it was launched.
	Options are:
	<ul><li>None –</li><li>Time</li></ul>
	Relative Time
	Duration
	Seconds
Wait Time	If Wait To Start = Time or Relative Time; Number of hours and minutes to wait before starting the task.

#### Wait Day Constraint If Wait Time = Time or Relative Time; Specification for whether or not to advance the wait time to another day. Valid values: -- None --• If Wait To Start = Time; Advance to the next day if the specified wait time is before the time that the task instance is eligible to start; that is, all dependencies have been met. For example: it is not being held, and it is not waiting on any predecessors. • If Wait To Start = Relative Time; Advance to the next day if the specified wait time is before the task instance Trigger Time or, if there is no Trigger Time, before the task instance Launch Time. In the latter case, when a task instance is within a workflow, it will inherit the Launch Time of the top-level parent workflow task instance. Same Dav Do not advance day. Next Day Advance to the next day. Next Business Day Advance to the next business day. Sunday If today is not Sunday, advance to next Sunday. Monday If today is not Monday, advance to next Monday. Tuesday If today is not Tuesday, advance to next Tuesday. Wednesday If today is not Wednesday, advance to next Wednesday. Thursday If today is not Thursday, advance to next Thursday. Friday If today is not Friday, advance to next Friday. Saturday If today is not Saturday, advance to next Saturday. Default is - None --. Wait Duration If Wait To Start = Duration; Number of days, hours, minutes, and seconds to wait before starting the task. Wait Duration In Seconds If Wait To Start = Seconds; Number of seconds to wait before starting the task. Delay On Start Amount of time to delay the start of a task, after it has been launched, from the time that it is eligible to start; that is, all dependencies have been met. For example: it is not being held, it is not waiting on any predecessors, or there is no wait time specified. Options are: None – Duration Seconds

Delay Duration	If Delay On Start = Duration; Number of days, hours, minutes, and seconds to delay after starting the task.
Delay Duration In Seconds	If Delay On Start = Seconds; Number of seconds to delay after starting the task.
Time Options	This section contains time-related specifications for the task instance.
Late Start	If enabled, and if the task instance starts after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late start (see Late Start Type). To determine whether a task instance started late, open the task instance and locate the Started Late field; the field is checked if the instance started after the specified time. The Started Late field displays in the task instance Details only if the user specified a Late Start in the task Details.
Started Late	System-supplied; this field is flagged if the task started later than the time specified in the Late Start fields.
Late Start Type	Required if Late Start is enabled.  Options:  Time - Flag the task if it starts after the specified time.  Duration - Flag the task if it starts a certain amount of time after the programmed start time. The task must have a specific start time.
Late Start Time	If Late Start Type = Time; Time after which the task start time is considered late. Use HH:MM, 24-hour time.

If Late Start Type = Time; Specification for whether or not to advance the late start time to another day.  Valid values:  • None
<ul> <li>Advance to the next day if the specified late start time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> </ul>
<ul> <li>Next Business Day     Advance to the next business day.</li> <li>Sunday     If today is not Sunday, advance to next Sunday.</li> <li>Monday</li> </ul>
If today is not Monday, advance to next Monday.  Tuesday If today is not Tuesday, advance to next Tuesday.  Wednesday If today is not Wednesday, advance to next Wednesday.
<ul> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Schuder</li> </ul>
<ul> <li>Saturday         If today is not Saturday, advance to next Saturday.     </li> <li>Nth Day         Advance to a specific number of days in the future.     </li> </ul>
Default is – None
If Late Start Day Constraint = Nth Day; Number of days to advance.
If Late Start Type = Duration; Duration (amount of relative time) after which the task is considered to have started late.
For a task within a workflow, the duration is the period between the time the workflow starts and the time the task itself starts. For example, a task might have a Late Start Duration of 60 minutes. If the workflow starts at 9:00 a.m. but the task itself does not start until 10:30, the task has started late.
For a task that is not within a workflow, Late Start Duration has meaning only if the task has been held upon starting. For example, if a task has a Late Start Duration of 60 minutes and the Hold on Start field is enabled, if the task is not released from hold within the amount of time specified in the Late Start Duration field, the task has started late.
If enabled, and if the task instance finishes after the time or period specified, the task instance is flagged as late. You can specify a time or duration to determine a late finish (see Late Finish Type). To determine whether a task instance finished late, open the task instance and locate the Finished Late field; the field is checked if the instance finished after the specified time or lasted longer than expected. This field only appears on the task instance if the user specified a Late Finish in the task definition.

Finished Late	System-supplied; this field is flagged if the task finished later than the time or duration specified in the Late Finish fields.
Late Finish Type	Required if Late Finish is enabled.  Options:
	<ul> <li>Time - Flag the task if it finishes after the specified time (see Late Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time after the programmed finish time (see Late Finish Duration). The task must have a specific finish time.</li> </ul>
Late Finish Time	If Late Finish Type = Time; Time after which the task finish time is considered late. Use HH:MM, 24-hour time.
Late Finish Day Constraint	If Late Finish Type = Time; Specification for whether or not to advance the late finish time to another day.  Valid values:
	<ul> <li>- None Advance to the next day if the specified late finish time is before the Created time of the task instance.</li> <li>Same Day Do not advance day.</li> <li>Next Day Advance to the next day.</li> <li>Next Business Day Advance to the next business day.</li> <li>Sunday If today is not Sunday, advance to next Sunday.</li> <li>Monday If today is not Monday, advance to next Monday.</li> <li>Tuesday If today is not Tuesday, advance to next Tuesday.</li> <li>Wednesday If today is not Wednesday, advance to next Wednesday.</li> <li>Thursday If today is not Thursday, advance to next Thursday.</li> <li>Friday If today is not Friday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Friday.</li> <li>Saturday If today is not Saturday, advance to next Saturday.</li> <li>Nth Day Advance to a specific number of days in the future.</li> </ul>
Late Finish Nth Amount	If Late Finish Day Constraint = Nth Day; Number of days to advance.

Late Finish Duration	If Late Finish Type = Duration; Longest amount of time this task instance should take to run.
Early Finish	If enabled, and if the task instance finishes before the time or period specified, the task instance is flagged as early. You can specify a time or duration to determine an early finish (see Early Finish Type). To determine whether a task instance finished early, open the task instance and locate the Finished Early field; the field is checked if the instance finished before the specified time or did not last as long as expected. This field only appears on the task instance if the user added Early Finish specifications to the task definition.
Finished Early	System-supplied; this field is flagged if the task finished earlier than the time specified in the Early Finish fields.
Early Finish Type	Required if Early Finish is enabled.  Options:
	<ul> <li>Time - Flag the task if it finishes before the specified time (see Early Finish Time).</li> <li>Duration - Flag the task if it finishes a certain amount of time before the programmed finish time (see Early Finish Duration). The task must have a specific finish time.</li> </ul>
Early Finish Time	If Early Finish Type = Time; Time before which the task finish time is considered early. That is, enter a time at which the task should still be running. Use HH:MM, 24-hour time.

Early Einigh	
Early Finish Day	If Early Finish Type = Time; Specification for whether or not to advance the early finish time to another day.
Constraint	
	Valid values:
	• None
	Advance to the next day if the specified early finish time is before the Created time of the task instance.
	Same Day
	Do not advance day.
	Next Day
	Advance to the next day.  • Next Business Day
	Advance to the next business day.
	• Sunday
	If today is not Sunday, advance to next Sunday.
	Monday
	If today is not Monday, advance to next Monday.
	<ul> <li>Tuesday         If today is not Tuesday, advance to next Tuesday.     </li> </ul>
	Wednesday
	If today is not Wednesday, advance to next Wednesday.
	Thursday
	If today is not Thursday, advance to next Thursday.
	• Friday
	If today is not Friday, advance to next Friday.  • Saturday
	If today is not Saturday, advance to next Saturday.
	Nth Day
	Advance to a specific number of days in the future.
	Default in Many
	Default is – None
Forly Finish	
Early Finish Nth Amount	If Early Finish Day Constraint = Nth Day; Number of days to advance.
14th Amount	in Early 1 mion Bay Condition — 14th Bay, 14th Bot of days to devance.
Early Finish	
Duration	If Early Finish Type = Duration; Shortest amount of time this task instance should take to run.
Retry	This section contains specifications for retrying the task.
Options	This seed on contains specifications for retrying the task.
Maximum Retries	User-defined; maximum number of times that the Controller should retry this task after it has started and gone to a failed state.
Retires	Oser-defined, maximum number of times that the Controller should retry this task after it has started and gone to a falled state.
Retry	Here defined indicates whather the Controller should continue to indefinitely to more this tool. If you conclude this field it assembles a controller of the Mariner Delice.
Indefinitely	User-defined; indicates whether the Controller should continue trying indefinitely to run this task. If you enable this field, it overrides any value placed in the Maximum Retries field.
	iiciu.
Retry Interval	Hear defined number of accorde between each rate.
(Seconds)	User-defined; number of seconds between each retry.

Current Retry Count	System-supplied; current number of times that the Controller has retried the task after it first went to failure status.
Suppress Intermediate Failures	User-defined; If the task instance is in the Failed status, indicates whether or not the following will be suppressed until all scheduled retry attempts (a Maximum Retries value has been entered or Retry Indefinitely has been enabled) have been made:
	All Actions (Abort, Email Notification, Set Variable, SNMP Notification, and System Operation) defined for the task instance on a Failed status.
	<ul> <li>Workflow conditional path processing; any Successors waiting on a failure path will not be released.</li> </ul>
	<ul> <li>Task Monitors will not be notified of the Failed status. Also, any Task Monitor task that has a Time Scope in the past will disqualify any matching task instance in the past with a Failed status if the task instance is scheduled for automatic retry and for which Suppress Intermediate Failures has been enabled.</li> </ul>
	Any Workflow containing the Failed task instance will not transition to the Running/Problems status.
Next Retry Time	System-supplied for a task instance in the Failed status that is scheduled for automatic retry; Next time that a retry will be made. If a task instance is not scheduled for automatic retry, Next Retry Time does not display in the task instance Details.
Critical Path Options	This section contains Critical Path-related specifications for the task.
CP Duration	Optional; Allows you to override the estimated Critical Path Duration of the task when running in a Workflow; used in conjunction with the CP Duration Unit field. In most cases, this field should be left blank, which implies that the Controller will estimate the Critical Path Duration based on historical executions. Valid values are any integer equal to or greater than 0. Variables and Functions are supported.
CP Duration (Resolved)	Displays the current resolved value of the CP Duration field, which may contain variables or functions that will be displayed as unresolved until the task instance starts. The CP Duration (Resolved) field can continue to change value until the task instance starts, at which time CP Duration will display as resolved and CP Duration (Resolved) will no longer be visible unless there was an issue resolving the variables and/or functions contained within CP Duration. If the Controller is unable to resolve CP Duration or it resolves to an invalid value, CP Duration will be ignored and the Controller will estimate the Critical Path Duration based on historical executions.
CP Duration Unit	Type of CP Duration; used in conjunction with the CP Duration field. For example, for a CP Duration of two minutes, specify 2 in the CP Duration field and select <b>Minutes</b> in this field.
	Options:
	<ul><li>Seconds</li><li>Minutes</li><li>Hours</li></ul>
	Default is Minutes.
Workflow Execution Options	This section contains Execution Restriction specifications for the task if it is within a Workflow.

Execution Restriction	Specification for whether or not there is a restriction for this task to be run, skipped, or held.
	Options are:
	<ul> <li> None No restriction for this task.</li> <li>Run Restriction for when this task will be run.</li> <li>Skip Restriction for when this task will be skipped.</li> <li>Hold Restriction for when this task will be held.</li> </ul>
	If Execution Restriction on a task is Run or Skip, then when it is part of a Workflow that is being launched, the Restriction Period is evaluated. The task instance will be skipped if Execution Restriction is Skip and the date is within the Restriction Period or Execution Restriction is Run and the date is not within the Restriction Period. Execution Restriction can be set to Skip with a Restriction Period of – None –, meaning the restriction is always active and the task will be skipped when it is part of a Workflow.
Restriction Period	If Execution Restriction = Run, Skip, or Hold; Period of time when the task is restricted.
	Options are:
	• - None -
	No period of restriction for this task.  • Before
	Restriction is valid if the date is before the Before Date value.  • After
	Restriction is valid if the date is after the After Date value.  • Span
	Restriction is valid if the date is before the Before Date value and after After Date value.  • On
	Restriction is valid if the date is one of the Date List values.
Before Date	If Restriction Period = Before or Span; Date before which the restriction is valid.
Before Time	If Restriction Period = Before or Span; Time on the selected date before which the restriction is valid.
After Date	If Restriction Period = After or Span; Date after which the restriction is valid.
After Time	If Restriction Period = After or Span; Time on the selected date after which the restriction is valid.
Date List	If Restriction Period = On; Date(s) on which the restriction is valid.
Statistics	This section contains time-related statistics for the task instance.

User Estimated End Time	System-supplied; if the user entered information into the User Estimated Duration field in the task Details, the Controller uses this information to calculate an end time for the task instance, based on the date/time the task instance started.
Average Estimated End Time	System-supplied; average estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Shortest Estimated End Time	System-supplied; shortest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Longest Estimated End Time	System-supplied; longest estimated end time of the task instance, calculated by the Controller based on the date/time the task instance started.
Projected End Time	System-supplied; projected end time of the task instance, calculated by the Controller based on the projected end time of its predecessor (or the maximum projected end time of all its predecessors, if more than one path exists to that task instance) plus its estimated critical path duration.
Metadata	This section contains Metadata information about this record.
UUID	Universally Unique Identifier of this record.
Updated By	Name of the user that last updated this record.
Updated	Date and time that this record was last updated.
Created By	Name of the user that created this record.
Created	Date and time that this record was created.
Status History	History of all statuses that the task instance has gone through.
Buttons	This section identifies the buttons displayed above and below the Task Instance Details that let you perform various actions.
Update	Saves updates to the record.
Force Finish	See Force Finishing a Task.
Hold	Places the task instance on Hold (see Putting a Task on Hold).
Skip	For tasks loaded into the schedule that have not yet run; allows you to tell the Controller to skip this task. See Skipping a Task.
Re-run	See Re-running a Task.

View Parent	Displays the task instance Details for the parent Workflow of this task instance.
Delete	Deletes the current record.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	For pop-up view only; closes the pop-up view of this task instance.
Tabs	This section identifies the tabs across the top of the Task Instance Details that provide access to additional information about the task instance.
Virtual Resources	Lists all Virtual Resources to which this task is assigned.
Exclusive Requests	Lists all records in the Exclusive Requests table (ops_exclusive_order) for this task instance.
Notes	Lists all notes associated with this record.

### **Running a Web Service Task**

You can run a Web Service task:

- Manually, by clicking the Launch Task or Launch Task with Variables button in the Web Service Tasks list or Web Service Task Details Action menu.
- As part of a workflow
- Specify triggers that run the task automatically based on times or events.

### **Monitoring Task Execution**

You can monitor all system activity from the Activity Monitor and can view activity history from the History list.

# **Creating Task Actions**

Universal Controller lets you create the following actions for tasks and workflows:

Action Type	Description
Abort	Allows you to abort a waiting or running task instance
Email Notification	Allows you to generate email notifications based on various events and statuses.
Set Variable	Allows you to set a variable to a specific value for a task or workflow.
SNMP Notification	Allows you to generate SNMP notifications to be sent to an SNMP Manager.
System Operation	Allows you to run a Universal Controller system operation based on specified conditions.

### **Abort Actions**

- Overview
- Creating an Abort Action
- Abort Action Details Field Descriptions

#### Overview

The Abort Action allows you to abort a task instance under the following circumstances:

- If a task instance is in a status less than Queued (40), the task instance is eligible for being skipped, and an Abort Action will skip that task instance.
- If a task instance is in a status greater than or equal to Queued (40) and less than Skipped (180), the task instance is not eligible for being skipped, and an Abort Action will Force Finish the task instance (with halt and cancel options configurable).

(For more details on the statuses and their numerical ordering, see Task Instance Status Types.)

Additionally, for running task instances, the Abort Action provides the ability to Force Finish and Cancel by using the Cancel Process if Active option and/or override the exit code of the Force Finished task instance by using the Override Exit Code option.

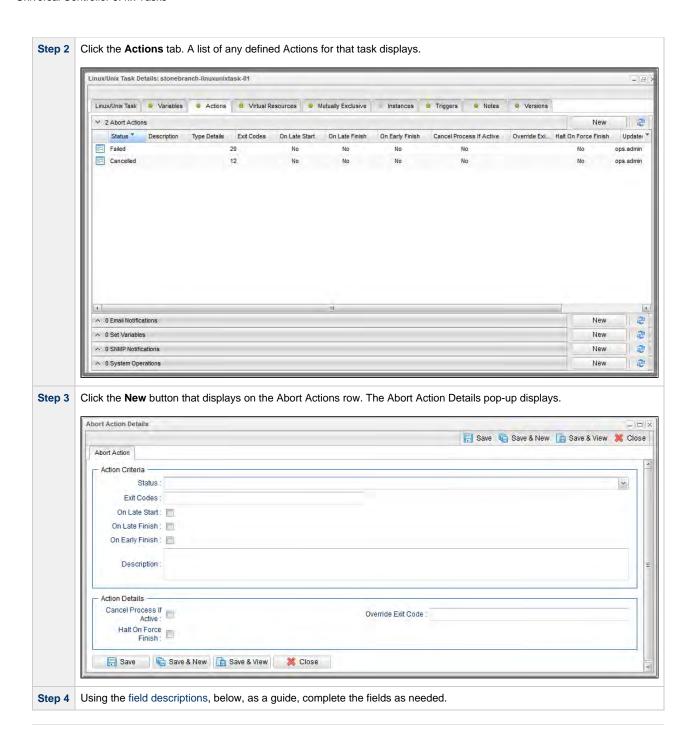

You can trigger this action based on one or more of the following events associated with the task instance:

- Status or statuses of the task instance
- Exit code(s) generated by the program (along with at least one status)
- Late start
- · Early or late finish

You can create one or more Abort Actions for any Universal Controller task. For Workflow tasks, you can also specify whether you want the Abort Action instructions to apply to the workflow itself, the workflow and/or its tasks, or to the tasks only.

### **Creating an Abort Action**

Step 1 Display the Task Details of the task for which you are creating the Abort Action.

Step 5	Click a <b>Save</b> button to save the record in the Controller database.
Step 6	If appropriate, repeat these steps for any additional Abort Actions you want to create.

## **Abort Action Details Field Descriptions**

The following table describes the fields and buttons that display in the Abort Actions Details.

Field Name	Description
Action Criteria	This section contains criteria for performing the action.
Action Inheritance	For Workflow tasks only; the records that this action applies to.
	Options:
	<ul> <li>Self         The action applies only to the workflow; it is not inherited by its children tasks. For example, if the action is defined for the Defined status, when the workflow where the action is specified transitions into the Defined status, the action will run for the workflow. When children tasks within this workflow transition into the Defined status, the action will not run.     </li> <li>Self/Children         The action applies to the workflow and any children under the workflow (it is as if each child under the workflow had the action specified on itself). For example, if the workflow or any of its children transition into the Defined status, the action will run.     </li> <li>Children</li> </ul>
	This action applies only to the children under the workflow and not the workflow itself. For example, if any child of this workflow transitions into the Defined status, the action will run. However, when the workflow where this action is specified transitions into the Defined status, this action will not run.
Status	The status of this task, by itself or together with an exit code, that will trigger the Abort action. You can specify as many statuses as needed.
Exit Codes	Specifies one or more exit codes that will trigger the event. If you specify an exit code, you must also specify at least one status. Use commas to separate multiple exit codes; use a hyphen to specify a range. Example: 1, 5, 22-30.
On Late Start	Generates the action or notification if the task started late, based on the Late Start Time specified in the task.
On Late Finish	Generates the action or notification if the task finishes late, based on the Late Finish time specified in the task.
On Early Finish	Generates the action or notification if the task finishes early, based on the Early Finish Time specified in the task.
Description	Description of this action.
Action Details	This section contains additional details about the action.

Cancel Process if Active	If enabled, instructs the Controller to Cancel the process that was launched by this task before Force Finishing the task.	
Halt On Force Finish	If enabled, instructs the Controller to Force Finish (Halt) a running task instance, rather than just Force Finish.	
Override Exit Code Overrides the exit code returned by the process with the exit code specified in this field. This enables you to you Force Finish a task instance with a specific exit code force the workflow to take a conditional path using Conditions.		
	Note If you run the Abort Action against a task that has not yet started, the task will be skipped, and the Override Exit Code is not applicable.	
Buttons	This section identifies the buttons displayed above and below the Action Details that let you perform various actions.	
Save	Saves a new Action record in the Controller database.	
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.	
Save & View	Saves a new record in the Controller database and continues to display that record.	
New	Displays empty (except for default values) Details for creating a new record.	
Update	Saves updates to the record.	
Delete	Deletes the current record.	
Refresh	Refreshes any dynamic data displayed in the Details.	
Close	Closes the Details pop-up of this action.	

### **Email Notification Actions**

- Overview
  - Notifications Based on Events
  - Notifications Based on Status
- Creating an Email Notification
- Email Notification Details Field Descriptions
  - Report Variable Resolution

### Overview

You can create one or more Email Notifications for any Universal Controller task. For workflow tasks, you can also specify whether you want the email to be triggered by the workflow itself, the workflow and/or its tasks, or by the tasks only.

In order to generate Email Notifications, there must be an Email connection defined, which provides the Email server name and other pertinent information.

#### **Notifications Based on Events**

You can generate notifications based on one or more of the following events associated with the task instance of the task for which you create the notification:

- Status or statuses of the task instance
- Exit code(s) generated by the program (along with at least one status)
- Late start
- · Early or late finish

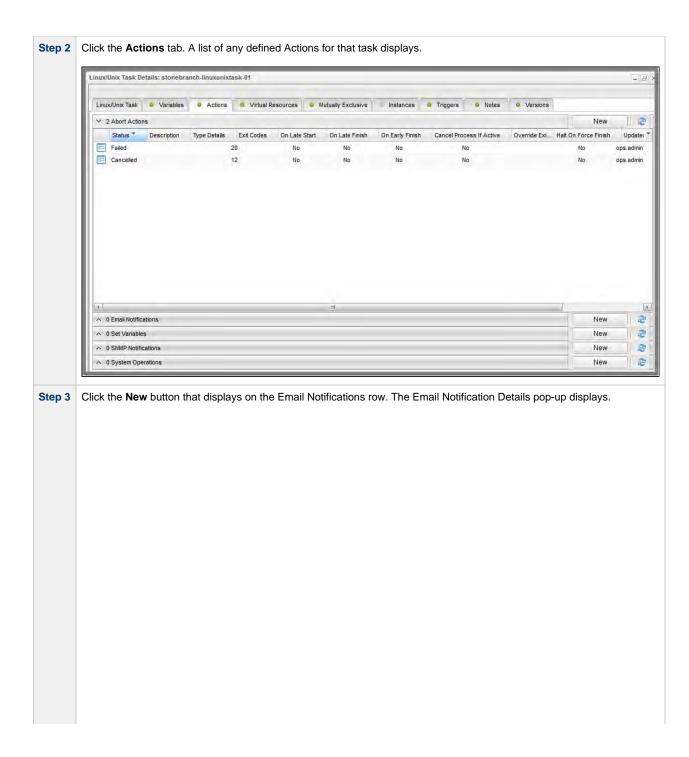

#### **Notifications Based on Status**

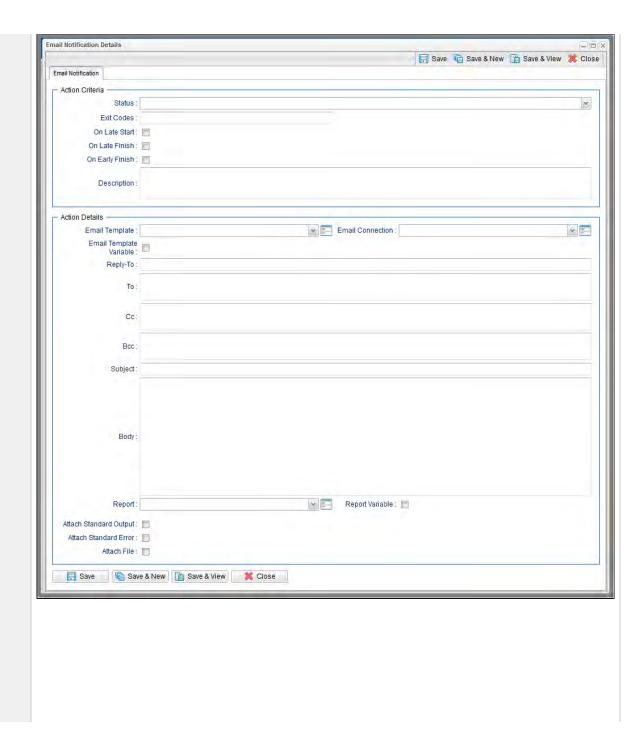

You also can generate notifications based on the status of:

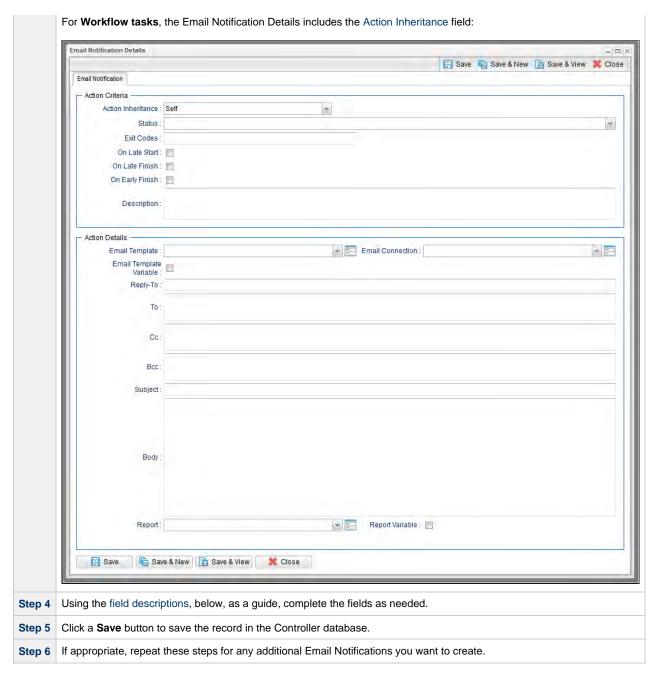

- · Agents and Agent clusters
- Cluster nodes
- OMS Servers

## **Creating an Email Notification**

Step 1 Display the Task Details of the task for which you are creating the Email Notification.

## **Email Notification Details Field Descriptions**

The table below describes the fields and buttons that display in the Email Notification Details.

Field Name	Description
Action Criteria	This section contains criteria for performing the action.
Action Inheritance	For Workflow tasks only; the records that this action applies to.
	Options:
	<ul> <li>Self         The action applies only to the workflow; it is not inherited by its children tasks. For example, if the action is defined for the Defined status, when the workflow where the action is specified transitions into the Defined status, the action will run for the workflow. When children tasks within this workflow transition into the Defined status, the action will not run.     </li> <li>Self/Children         The action applies to the workflow and any children under the workflow (it is as if each child under the workflow had the action specified on itself). For example, if the workflow or any of its children transition into the Defined status, the action will run.     </li> <li>Children         This action applies only to the children under the workflow and not the workflow itself. For example, if any child of this workflow transitions into the Defined status, the action     </li> </ul>
	will run. However, when the workflow where this action is specified transitions into the Defined status, this action will not run.
Status	The status of this task, by itself or together with an exit code, that will trigger this Email Notification action. You can specify as many statuses as needed.
Exit Codes	Specifies one or more exit codes that will trigger the event. If you specify an exit code, you must also specify at least one status. Use commas to separate multiple exit codes; use a hyphen to specify a range. Example: 1, 5, 22-30.
On Late Start	Generates the action or notification if the task started late, based on the Late Start Time specified in the task.
On Late Finish	Generates the action or notification if the task finishes late, based on the Late Finish time specified in the task.
On Early Finish	Generates the action or notification if the task finishes early, based on the Early Finish Time specified in the task.
Description	Description of this action.
Action Details	This section contains additional details about the action.

Email Template	Name of an Email template defined in an Email Template Details. An Email template allows you to specify standard recipients and text for outgoing emails. Enter the name of an existing Email template, select an Email template from the drop-down list, or click the Details icon to create a new Email template.  Every Email template specifies an Email connection. If you do not specify an Email template in this field, you must specify an Email connection in the Email Connection field.  If you specify both an Email template (in this field) and an Email Connection, the Email server specified in the Email Connection field overrides the Email server specified in this field.  (Any information specified in an Email task overrides what is specified in an Email template.)	
Email Template Variable	Indication of whether the Email Template field is a reference field for selecting a specific Email Template (unchecked) or a text field for specifying the Email Template as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.	
	Note When updating multiple Tasks, to change from using a Email Template reference to using a Email Template variable, you must change the Email Template Variable field to Yes and specify the Email Template variable in the Email Template Unresolved field. Conversely, to change from using an Email Template variable to using an Email Template reference, you must change the Email Template Variable field to No and specify the Email Template reference in the Email Template field.  Template field.	
Email Connection Required if an Email Template is not specified in the Email Template field; Name of an outgoing Email Connection (Type = Outgoing). An Email Connection specific about an outgoing or incoming email server. Enter the name of an existing outgoing Email Connection, select an existing outgoing Email Connection from the drop the Email Connection field and click the Details icon to create a new Email Connection (Outgoing will be pre-selected in the Type field).  If you specify both an Email Template and an Email Connection (in this field), the Email Connection specified in this field overrides the Email Connection specified Template field.		
Reply-To	Email address of the sender. Use commas to separate multiple recipients. Variables and functions supported.	
То	Email address of the recipient. Use commas to separate multiple recipients. Variables and functions supported.	
CC	Email address of the party being sent a copy of the email, if any. Use commas to separate multiple recipients. Variables and functions supported.	
BCC	Email address of the party being sent a blind (hidden) copy of the email, if any. Use commas to separate multiple recipients. Variables and functions supported.	
Subject	Subject line of the email. Variables and functions supported.	

Body	Text of the email message. Variables and functions supported. If both the email template and the email task contain text in the body, the text is appended.
Report	Report to attach to this notification.
Report Variable	Indication of whether the Report field is a reference field for selecting a specific Report (unchecked) or a text field for specifying the Report as a variable (checked). Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
Attach Standard Output	For Agent-based tasks only; attach any standard output generated by the associated task.
Attach Standard Error	For Agent-based tasks only; attach standard error data generated by the associated task.
Attach File	For Agent-based tasks only (except z/OS); attach any single text file that is accessible by the Agent. Full path name is required. Wildcards are NOT supported.
	The Controller will request the file from the agent. If the file does not exist, the Agent will return a file output type with the content: OPSWISE WARNING - File is not available.
Attach Job Log	For z/OS tasks only; attach any job logs generated by the associated task.
Start Line	Attach data beginning at the line indicated.  • If a <b>Start Line</b> value is not specified, the default is 1.  • If the <b>Start Line</b> value is <b>-1</b> , data will be retrieved starting at the end of the file.
Number of Lines	Allows you to limit the retrieved data to the number of lines specified. If a Number of Lines value is not specified, the default is the value of the Retrieve Output Default Maximum Lines Universal Controller system property.
Scan Text:	Regex pattern that the Controller will search for a match for in STDOUT/STDERR or a specified file. The Controller will include the <b>Number of Lines</b> above and below the first line matched.
	if the Regex pattern is not found, the following message is returned: OPSWISE WARNING - Scan text string not found.
File Name	For Attach File only; path and file name of the file you want to attach to the email notification.
Buttons	This section identifies the buttons displayed above and below the Action Details that let you perform various actions.
Save	Saves a new Action record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.

Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new record.
Update	Saves updates to the record.
Delete	Deletes the current record.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	Closes the Details pop-up of this action.

### **Report Variable Resolution**

Reports do not have to be unique by Title. However, Reports with the same Title must be unique per visibility: per User, per Group, and per Everyone.

Accordingly, the following applies regarding Report Variable field resolution.

Once resolved, the Report Variable field value could match multiple Reports with the same Title, but with different visibilities. Therefore, there is an order of precedence to choosing the report by Title:

- 1. User visibility (execution user).
- 2. Group visibility (execution user's groups).
- 3. Everyone visibility.
- 4. Any other report(s). (This is applicable only in the case of an administrator who can view all reports.)

If the execution user belongs to more than one Group, and there is more than one report matching the Title visible to those Groups, the first report found will be chosen.

If multiple reports are found by resolved report Title, the following will be logged:

Found more than one report with name <report-title> visible to execution user <execution-user>.

If the resolved report Title does not match any report visible to the execution user, the notification will be delivered containing the following error message:

Could not find report with name <report-title> visible to execution user <execution-user>.

If the report variable cannot be resolved, the notification will be delivered containing the following error message:

Report variable not resolved.

A Report Variable that resolves to blank implies that no report should be included. This is not considered an error; the notification will proceed as normal.

## **Set Variable Actions**

For information on how to create Set Variable actions for use within a task or workflow, see Creating a Set Variable Action within a Task or Workflow in Variables and Functions.

## **SNMP Notification Actions**

- Overview
- Creating an SNMP Notification
- SNMP Notification Details Field Descriptions

### **Overview**

You can create one or more SNMP notifications for any Universal Controller task. For workflow tasks, you can also specify whether you want the SNMP notification to be triggered by the workflow itself, the workflow and/or its tasks, or by the tasks only.

You can trigger the notification based on one or more of the following events associated with the task instance to which you attach the notification:

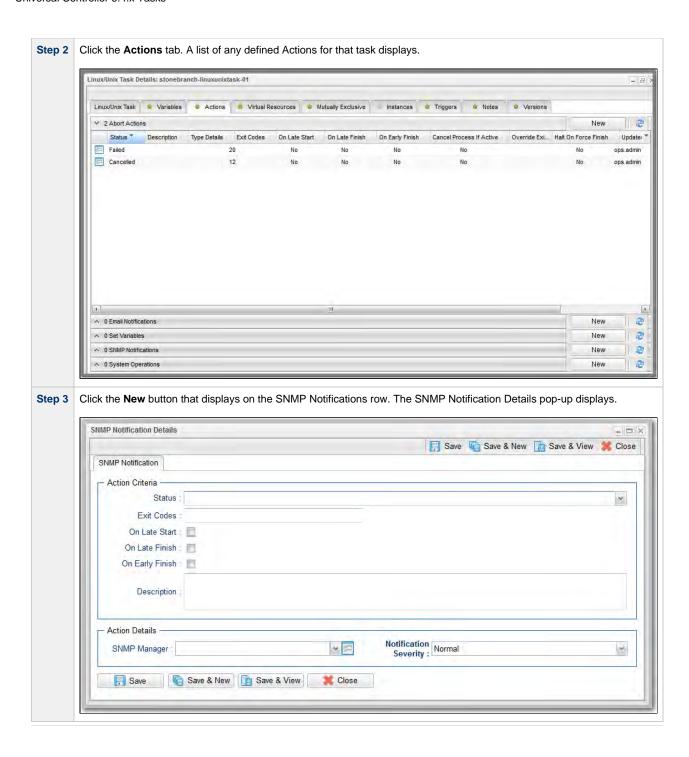

- Status or statuses of the task instance
- Exit code(s) generated by the program (along with at least one status)
- Late start
- · Early or late finish

In order to generate SNMP notifications, there must be an SNMP Manager defined, which provides the server name and other pertinent information of the SNMP Manager that will receive the notification.

You also can generate notifications based on the status of Agents and Agent clusters, Cluster nodes, and OMS Servers.

## **Creating an SNMP Notification**

**Step 1** Display the Task Details of the task for which you are creating the SNMP Notification.

Step 4	Using the field descriptions, below, as a guide, complete the fields as needed.
Step 5	Click a <b>Save</b> button to save the record in the Controller database.
Step 6	If appropriate, repeat these steps for any additional Email Notifications you want to create.

# **SNMP Notification Details Field Descriptions**

The table below describes the fields and buttons that display in the SNMP Notification Details.

Field Name	Description
Action Criteria	This section contains criteria for performing the action.
Action Inheritance	For Workflow tasks only; the records that this action applies to.  Options:  Self The action applies only to the workflow; it is not inherited by its children tasks. For example, if the action is defined for the Defined status, when the workflow where the action is specified transitions into the Defined status, the action will run for the workflow. When children tasks within this workflow transition into the Defined status, the action will not run.  Self/Children The action applies to the workflow and any children under the workflow (it is as if each child under the workflow had the action specified on itself). For example, if the workflow or any of its children transition into the Defined status, the action will run.  Children This action applies only to the children under the workflow and not the workflow itself. For example, if any child of this workflow transitions into the Defined status, the action will run. However, when the workflow where this action is specified transitions into the Defined status, this action will not run.
Status	The status of this task, by itself or together with an exit code, that will trigger this SNMP Notification action. You can specify as many statuses as needed.
Exit Codes	Specifies one or more exit codes that will trigger the event. If you specify an exit code, you must also specify at least one status. Use commas to separate multiple exit codes; use a hyphen to specify a range. Example: 1, 5, 22-30.
On Late Start	Generates the action or notification if the task started late, based on the Late Start Time specified in the task.
On Late Finish	Generates the action or notification if the task finishes late, based on the Late Finish time specified in the task.
On Early Finish	Generates the action or notification if the task finishes early, based on the Early Finish Time specified in the task.
Description	Description of this SNMP notification.

Action Details	This section contains additional details about the action.
SNMP Manager	The SNMP Manager that will receive the SNMP notification. Enter the name of an existing SNMP Manager, select an existing SNMP Manager from the drop-down list, or clear the SNMP Manager field and click the Details icon to create a new SNMP Manager.
Notification Severity	Severity of this notification.  Options:  Normal (1) Warning (2) Minor (3) Major (4) Critical (5)
Buttons	This section identifies the buttons displayed above and below the Action Details that let you perform various actions.
Save	Saves a new Action record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new record.
Update	Saves updates to the record.
Delete	Deletes the current record.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	Closes the Details pop-up of this action.

## **System Operation Actions**

- Overview
- Creating a System Operation
- System Operation Details Field Descriptions

### **Overview**

A System Operation allows you to run a Universal Controller system operation based on specified conditions.

You can trigger the operation based on one or more of the following events associated with the task instance:

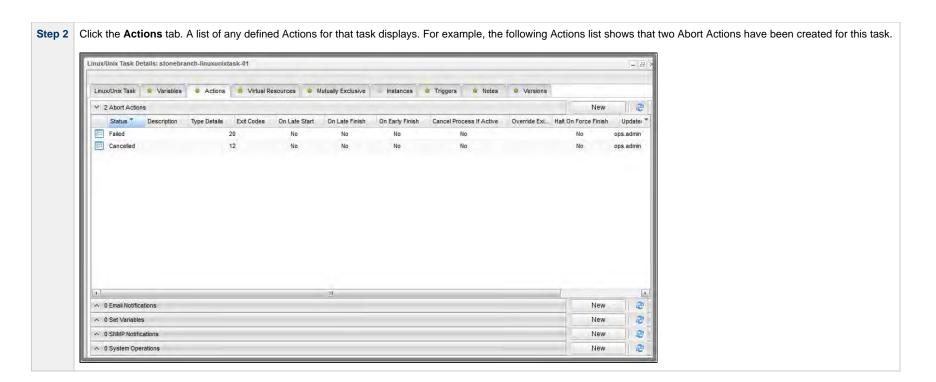

- · Status or statuses of the task instance
- Exit code(s) generated by the program (along with at least one status)
- Late start
- · Early or late finish

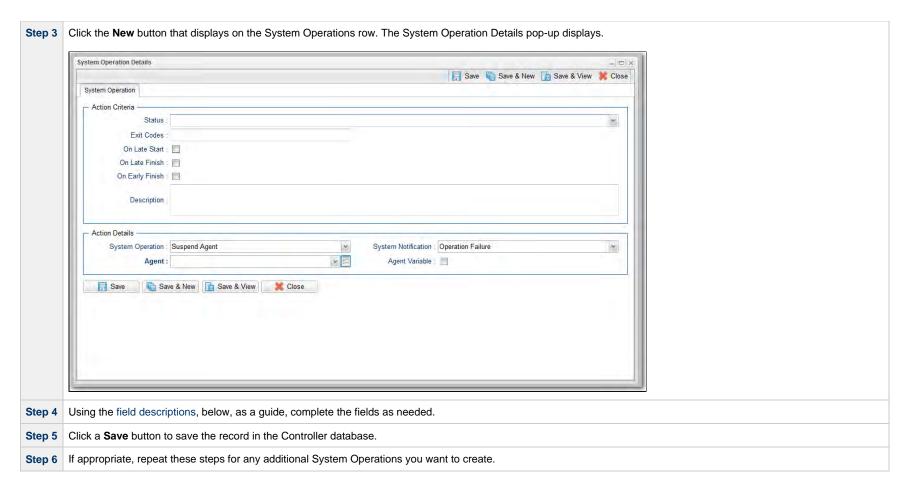

You can create one or more System Operations for any Controller task. For Workflow tasks, you can also specify whether you want a System Operation action to apply to the workflow itself, the workflow and/or its tasks, or to the tasks only.

System Operations will run under the security context of the dask instance Execution User, which must have the appropriate privileges for the specified Operation Type; otherwise, the System Operation will be prohibited.

## **Creating a System Operation**

**Step 1** Display the Task Details of the task for which you are creating the System Operation.

## **System Operation Details Field Descriptions**

The table below describes the fields and buttons that display in the System Operation Details.

Field Name	Description
Action Criteria	This section contains criteria for performing the action.
Type Details	Displays - on the System Operations actions list - the type of System Operation defined in this action.

Action Inheritance	For Workflow tasks only; the records that this action applies to.
	Options:
	<ul> <li>Self The action applies only to the workflow; it is not inherited by its children tasks. For example, if the action is defined for the Defined status, when the workflow where the action is specified transitions into the Defined status, the action will not run.</li> <li>Self/Children The action applies to the workflow and any children under the workflow (it is as if each child under the workflow had the action specified on itself). For example, if the workflow or any of its children transition into the Defined status, the action will run.</li> <li>Children This action applies only to the children under the workflow and not the workflow itself. For example, if any child of this workflow transitions into the Defined status, the action will run. However, when the workflow where this action is specified transitions into the Defined status, this action will not run.</li> </ul>
Status	The status of this task, by itself or together with an exit code, that will trigger this trigger a System Operation action. You can specify as many statuses as needed.
Exit Codes	Specifies one or more exit codes that will trigger the event. If you specify an exit code, you must also specify at least one status. Use commas to separate multiple exit codes; use a hyphen to specify a range. Example: 1, 5, 22-30.
On Late Start	Generates the action or notification if the task started late, based on the Late Start Time specified in the task.
On Late Finish	Generates the action or notification if the task finishes late, based on the Late Finish time specified in the task.
On Early Finish	Generates the action or notification if the task finishes early, based on the Early Finish Time specified in the task.
Description	Description of this System Operation.
Action Details	This section contains additional details about the action.

### System Operation

Specific system operation to perform.

#### Options:

- Suspend Agent
- Resume Agent
- Suspend Agent Cluster
- Resume Agent Cluster
- Suspend Cluster Membership
- Resume Cluster Membership
- Set Agent Task Execution Limit
- Set Cluster Task Execution Limit
- Set Virtual Resource Limit
- Run Task Instance Command
- Launch Task
- Trigger Now

#### Note

For the Suspend Agent and Resume Agent operations, the user must have the following Agent permissions:

- Explicit Read permission, if the Strict Business Service Membership Read Constraints Universal Controller system property is true.
- Suspend Agent and Resume Agent commands permission.

For the Suspend Agent Cluster, Resume Agent Cluster, Suspend Agent Cluster Membership, and Resume Agent Cluster Membership operations, the user must have the following Agent Cluster permissions:

- · Explicit Read permission, if the Strict Business Service Membership Read Constraints Universal Controller system property is true.
- Suspend Agent, Resume Agent, Suspend Agent Membership, and Resume Agent Membership commands permission.

### System Notification

Status of the specified system operation (see above) that will trigger a system notification.

#### Options:

- None
- Operation Failure (default)
- Operation Success/Failure
- Operation Success

#### Note

The Controller must be configured for system notifications in order for system notifications to be triggered.

### Agent

If System Operation is Suspend Agent, Resume Agent, Suspend Cluster Membership, Resume Cluster Membership, or Set Agent Task Execution Limit; Agent for which the system operation is to be performed.

### Agent Variable

If System Operation is Suspend Agent, Resume Agent, Suspend Cluster Membership, Resume Cluster Membership, or Set Agent Task Execution Limit:

If enabled, the Agent field converts from a reference field (where you browse and select a record) into a text field that allows you to enter a variable. Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.

Agent Cluster	If System Operation is Suspend Agent Cluster, Resume Agent Cluster, Suspend Cluster Membership, Resume Cluster Membership, or Set Cluster Task Execution Limit; Agent Cluster for which the system operation is to be performed.
Agent Cluster Variable	If System Operation is Suspend Agent Cluster, Resume Agent Cluster, Suspend Cluster Membership, Resume Cluster Membership, or Set Cluster Task Execution Limit;
	If enabled, the Agent Cluster field converts from a reference field (where you browse and select a record) into a text field that allows you to enter a variable. Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
Task Execution Limit	If System Operation is Set Agent Task Execution Limit or Set Cluster Task Execution Limit; Specification for whether a Limited or Unlimited number of task instances can be run concurrently on the specified Agent / Agent Cluster. (Default is Unlimited.)
Virtual Resource	If System Operation is Set Virtual Resource Limit; Virtual resource for which a virtual resource limit is to be set.
	Note If the Strict Business Service Membership Read Constraints Universal Controller system property is true, the drop-down list displays only Virtual Resources for which the user has explicit Read permission.
Virtual Resource Variable	If System Operation is Set Virtual Resource Limit; the Virtual Resource field (if enabled) converts from a reference field (where you browse and select a record) into a text field that allows you to enter a variable. Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
Limit	If System Operation is Set Agent Task Execution Limit or Set Cluster Task Execution Limit, and Task Execution Limit is Limited; Number of tasks that can be run concurrently by the specified Agent / Agent Cluster.
	If System Operation is Set Virtual Resource Limit; Virtual resource limit to be set for the specified virtual resource.

### Command

If System Operation is Run Task Instance Command; Type of task instance command to run.

#### Options:

- Cancel
- Force Finish
- Force Finish (Halt)
- Force Finish/Cancel
- Force Finish/Cancel (Halt)
- Skip
- Skip Path
- Unskip
- Hold
- Release
- Release Recursive
- Clear All Dependencies
- Clear Exclusive
- Clear Predecessors
- Clear Resources
- Clear Timewait
- Re-run

#### Caution

If you choose to re-run a task instance, care must be taken to not create unintended loop situations. For example, if a task contains a System Operation that specifies the re-run of that same task if the task instance ends in the Failed status, this will cause an endless loop of re-runs. If the task also contains a System Notification / Email Notification that sends an email if the task instance ends in Failed status, the emails could flood the recipient's mail server.

#### Workflow Instance Name Condition

If System Operation is Run Task Instance Command; Optional. Type of condition for the name of the parent workflow task instance that contains the task on which to perform the specified action.

The action will be performed only on a task instance in a parent workflow task instance meeting the specified condition value.

#### Options:

- Equals
- Starts With
- Contains
- Ends With

For the selected condition (the default is Equals), a corresponding field displays (see below) that allows you to enter a value for that condition.

### Workflow Instance Name Equals

If Workflow Instance Name Condition = Equals; Exact name of a parent workflow task instance containing the task. Variables are supported.

### Workflow Instance Name Starts With

If Workflow Instance Name Condition = Starts With; Character string at the start of the name of a parent workflow task instance containing the task. Variables are supported.

### Workflow Instance Name Contains

If Workflow Instance Name Condition = Contains; Character string in the name of a parent workflow task instance containing the task. Variables are supported.

Workflow Instance Name Ends With	If Workflow Instance Name Condition = Ends With; Character string at the end of the name of a parent workflow task instance containing the task. Variables are supported.
Instance Lookup Option	If System Operation is Run Task Instance Command; Specification for how to search for the task instance to run a command against.  Options:  Instance Name Instance Name/Task Instance Id Task
Instance Name	If Instance Lookup Option is Instance Name or Instance Name/Task; Required. Name of the task instance to run the command against. Variables supported.
Instance Criteria	If Instance Lookup Option is Instance Name, Instance Name/Task, or Task; Additional criteria for selecting a specific task instance if multiple task instances have matching names.  Oldest Active Instance (default) Newest Active Instance Newest Instance (Unskip command only) Oldest Instance (Unskip command only) (An Active task instance is an instance that is not in any of these statuses: Skipped, Finished, Success.)
Task Reference	<ul> <li>If Instance Lookup Option is Instance Name/Task or Task; Required. Name of the task for which the task instance was run.</li> <li>If System Operation is Launch Task; Name of the task to launch.</li> </ul>
Task Reference Variable	If Instance Lookup Option is Instance Name/Task or Task, or if System Operation is Launch Task; the Task field (above) converts from a reference field (where you browse and select a record) into a text field that allows you to enter a variable. Use the format: \${variable name}. The variable must be a supported type as described in Variables and Functions.
Instance Id	If Instance Lookup Option is Instance Id; ID of task instance to run the command against. The instance Id (sysid) is a 32-character universally unique identifier. You can use the \${ops_task_id} variable or \${_siblingid('mytask')} function to get the instance Id.
Trigger Reference	If System Operation is Trigger Now; Name of the trigger.
Trigger Reference Variable	If System Operation is Trigger Now; Indication of whether the <b>Trigger Reference</b> field is a reference field for selecting a specific Trigger (unchecked) or is a text field for specifying the trigger as a variable (checked). For a variable, use the format: \${variable name}\$. The variable must be a supported type as described in Variables and Functions.
Override Variables	If System Operation is Launch Task or Trigger Now; Variables to override.
Override Variables Resolution Disabled	If System Operation is Launch Task or Trigger Now; Indication of whether or not Override Variables resolution should be disabled to allow for passing unresolved variable values.  • If enabled (checked), Override Variables will be left unresolved. Any unresolved variables will be resolved in the context of the launched or triggered task instance.  • If disabled (unchecked), Override Variables will be resolved prior to the execution of the Launch Task or Trigger Now System Operation.
Buttons	This section identifies the buttons displayed above and below the Action Details that let you perform various actions.
Save	Saves a new Action record in the Controller database.

Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new record.
Update	Saves updates to the record.
Delete	Deletes the current record.
Refresh	Refreshes any dynamic data displayed in the Details.
Close	Closes the Details pop-up of this action.

# **Copying Tasks**

- Overview
- · Copying One or More Tasks from a Tasks List
- Copying a Task from the Task Details
- Copy Permissions

## Overview

You can make copies of all Universal Controller records, including tasks, using the standard method for Copying a Record: selecting Insert on the Action menu.

However, this method does not make copies of any records that are associated with the copied record. For tasks, **Insert** does not make copies of any Variables, Actions, and Notes that are associated with the task.

The Copy option allows you to make a complete copy of a task, including all of its associated records. It does not copy referenced records, such as virtual resources, but retains the relationship to these records for the copied task.

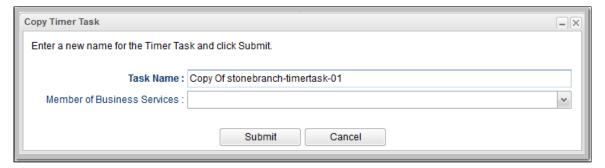

# **Copying One or More Tasks from a Tasks List**

Step 1	From the Automation Center navigation pane, select <b>Tasks &gt; <task type=""></task></b> . The Tasks list for that task type displays.
Step 2	Locate the task(s) you want to copy (see Filtering).

### Step 3 Copy the task(s):

#### Copy One Task

- 1. Right-click the Task Name.
- 2. On the Action menu, select Copy. A Copy Task pop-up dialog displays.

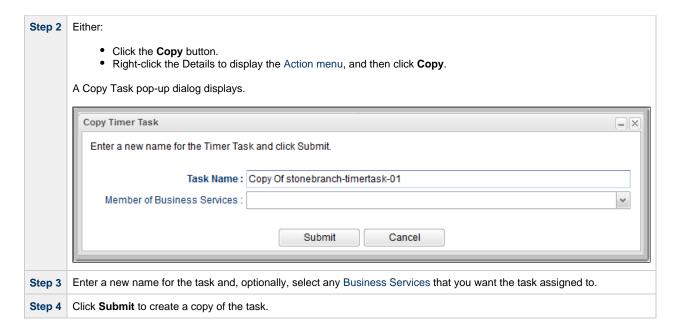

- 3. Enter a new name for the task and, optionally, select any Business Services that you want the task assigned to.
- 4. Click Submit to create a copy of the task.

### **Copy Multiple Tasks**

- 1. Ctrl-Click the tasks you want to copy.
- 2. Right-click any of the selected tasks.
- 3. On the Action menu, select Copy.
- 4. On the Confirmation pop-up that displays, click **OK**. The copied tasks are added to the list, with **Copy of** added as a prefix to the Task Name for each task. If a task with that **Copy of** name already exists, a numerical suffix is added to the task name.

## Copying a Task from the Task Details

**Step 1** Select a task from a Tasks list. The Task Details for that task displays.

# **Copy Permissions**

To copy a Task, you must have both Read permission and Copy command permission for the Task you are copying, in addition to having Create permission for the copied Task.

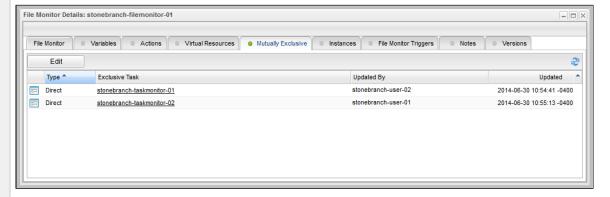

# **Setting Mutually Exclusive Tasks**

## **Setting Mutually Exclusive Tasks**

You can set a task to be mutually exclusive with one or more other tasks. Universal Controller does not permit mutually exclusive tasks to run at the same time; if one is running, the other(s) will wait before running.

To set mutually exclusive tasks:

Step 1 Select a task from a Tasks list and, in the Task Details for that task, click the **Mutually Exclusive Tasks** tab. The Mutually Exclusive Tasks list displays a list of any tasks that have been set to be mutually exclusive with this task:

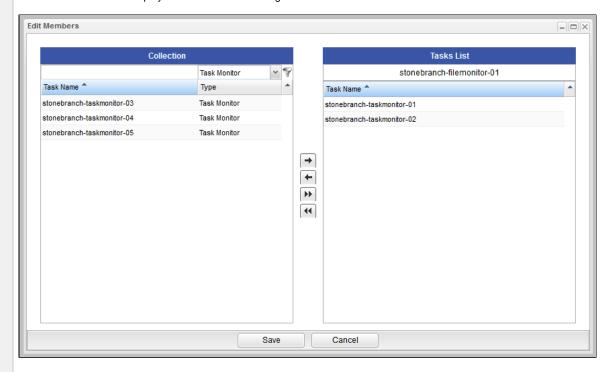

For each Exclusive Task on the list, the Type field indicates how the mutually exclusive dependency on the Exclusive Task was added to this task:

- Direct indicates that the mutually exclusive dependency on the Exclusive Task was added to this task manually in these task Details.
- Indirect indicates that the mutually exclusive dependency on the Exclusive Task was added to this task automatically when mutually exclusive dependency on this task was added manually to the Exclusive Task in its task Details.

You only can delete Direct mutually exclusive tasks.

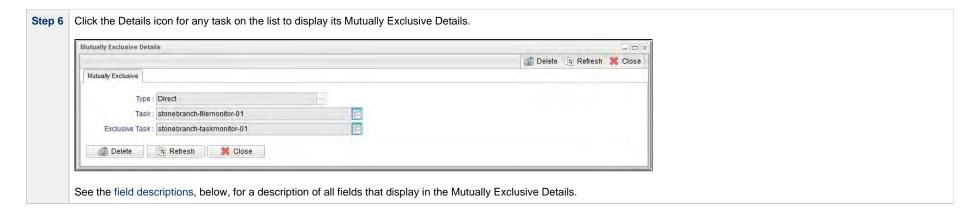

Step 2 Click the Edit button to display the Edit Members dialog.

- The Collection window displays all Controller tasks. To display only a specific type of task, select that task type from the drop-down field at the top of the Collection window.
- The Tasks List window displays all tasks that are to be run mutually exclusive with this task.
- Step 3 If you want to filter the tasks in the Collection window, click the filter icon (see Filtering for information about how to construct a filter.)
- **Step 4** Move tasks from the **Collection** window to the **Tasks List** window:
  - 1. To move a single task, double-click it or click it once and then click the > arrow.
  - 2. To move multiple tasks, Ctrl-click them and then click the > arrow.
  - 3. To move all tasks, click the >> arrow.

To move tasks from the **Tasks List** window to the **Collection** window:

- 1. To move a single task, double-click it or click it once and then click the < arrow.
- 2. To move multiple tasks, Ctrl-click them and then click the < arrow.
- 3. To move all tasks, click the << arrow.
- Step 5 Click Save. All of the tasks in the Tasks List window will be listed as Type Direct on the Mutually Exclusive list for this task, and all of the tasks in the Tasks List window will list this task as Type Indirect on their Mutually Exclusive Tasks lists.

## **Mutually Exclusive Task Field Descriptions**

The following table describes the fields that display in the Mutually Exclusive Task Details.

Field Name	Description
Туре	Type of Mutually Exclusive task: Direct or Indirect.
Task	Name of the task for which this task was made Mutually Exclusive.
Exclusive Task	Name of this Mutually Exclusive task.

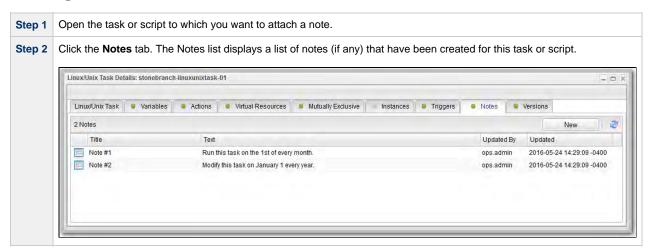

# **Creating Notes**

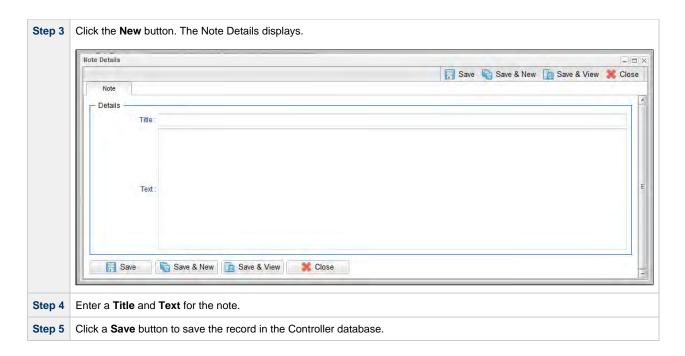

- Introduction
- Adding a Note
- Note Details Field Descriptions
- Deleting a Note

## Introduction

You can create a note for any Universal Controller task or script. The note can consist of information needed by operations personnel or other instructions or tips.

## **Adding a Note**

# **Note Details Field Descriptions**

Field Name	Description
Details	This section contains detailed information about the note.
Title	Title of this note. Displays in the Title column on the Notes list.
Text	Text of the note.
Buttons	This section identifies the buttons displayed above and below the Note Details that let you perform various actions.
Save	Saves a new record in the Controller database.
Save & New	Saves a new record in the Controller database and redisplays empty Details so that you can create another new record.
Save & View	Saves a new record in the Controller database and continues to display that record.
New	Displays empty (except for default values) Details for creating a new record.
Update	Saves updates to the record.

Refresh	Refreshes any dynamic data displayed in the Details.
Delete	Deletes the current record.
Close	For pop-up view only; closes the pop-up view of this task.

# **Deleting a Note**

To delete a note, either:

- Right-click the note in the Notes list and then click **Delete**.
  Open the note you want to delete and click the **Delete** button.

# **Monitoring Task Activity**

Universal Controller lets you perform the following actions related to the monitoring of tasks and Workflows:

- Monitoring Activity from the Activity Monitor
- Monitoring Activity from the Task Instances List
  Monitoring Activity History
- Monitoring Workflows
- Viewing Task Instances for a Specific Task
  Displaying Task Instance Status
  Retrieving Output

# **Monitoring Activity from the Activity Monitor**

- Overview
- Accessing the Activity Monitor
- Activity Monitor Column Descriptions
- · Activity Monitor Task Bar
  - Time Constraint
  - Quick Filter
  - Custom Filter
  - Refresh
- · Activity Monitor Display Task Bar
  - Settings

    - Start and Stop Activity Monitor
    - Page Navigation Buttons
    - Page Numbers
- Displaying Task Instance Details
- Issuing Commands Against Task Instances

#### Overview

The Activity Monitor is the Universal Controller central console of activity, a real-time display of task instance status. It displays a list of task instances contained in the Universal Controller All Task Instances table (ops\_exec), as controlled by your selections in the Activity Monitor Selections task bar at the top of the list.

A task bar below the list allows you to control displays settings for the selected task instances.

A task instance is the "run" version of a task. Each time a task runs, the Controller creates a task instance and monitors its activity on the Activity Monitor. Each task instance is a separate record.

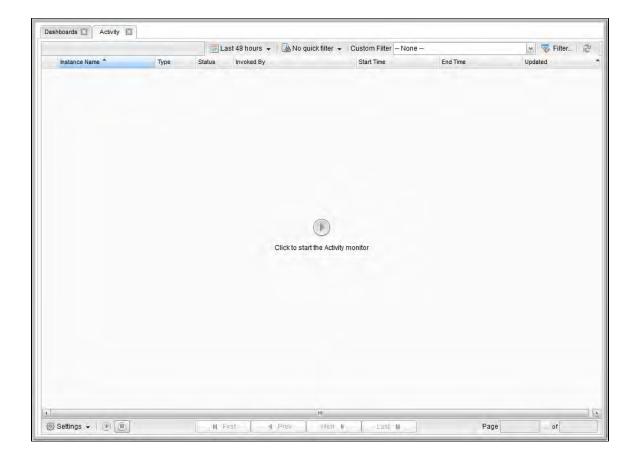

The Activity Monitor allows you to issue commands against task instances. You can also issue commands from the Task Instances list (and the Task Instances list for a specific task). In cases where the task Details did not instruct the Controller to retrieve output automatically, you can retrieve output manually from any completed task.

## **Accessing the Activity Monitor**

From the Automation Center navigation pane, select Task Instances > Activity. The Activity Monitor displays task status information based on the settings in the Activity Monitor Selections Task

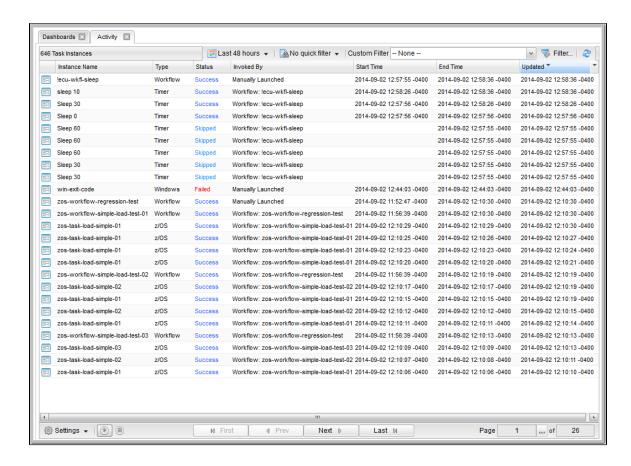

When you first log in to the Controller, the Activity Monitor does not automatically monitor Controller activity, since the Activity Monitor Automatically user preference value, by default, is set to No. You can change this value at any time.

The following is a sample Activity Monitor that is not monitoring activity.

You can manually start the Activity Monitor at any time by clicking the Start button in the center of the screen. You also can manually start or stop the Activity Monitor at any time from the Activity Monitor Display task bar. However, on your next login to the Controller, the Activity Monitor Automatically value will determine whether or not the Activity Monitor automatically starts monitoring the Controller.

The following is a sample Activity Monitor that is monitoring activity.

#### Note

Once you have displayed the Activity Monitor, it remains open throughout your Controller session unless you manually close it by clicking the x icon in the Activity Monitor tab at the top of the page. (The same is true for the Dashboards.)

If you click a page in the Navigator while viewing the Activity Monitor or Dashboards, a new tab for that page will open. The Activity Monitor and Dashboards tabs remain at the top of the screen if you navigate from them, providing for a quick return to those pages.

## **Activity Monitor Column Descriptions**

The following table describes the default columns of information displayed on the Activity Monitor.

Column Name	Description
Instance Name	Name of this task instance.
Туре	Type of task instance.
Status	Current status of this task instance.
Invoked By	<ul> <li>How the task instance was launched. One of the following:</li> <li>Trigger: (Trigger Name) - The instance was launched by the named trigger.</li> <li>Workflow: (Workflow Name) - The instance was launched by the named workflow.</li> <li>Manually Launched - The instance was launched by a user. To determine the name of the user: <ol> <li>From the Activity or Task Instances screen, click the task instance name to open the record.</li> <li>The Execution User field identifies the user who launched the task instance.</li> </ol> </li> </ul>
Start Time	Date and time the task instance started.
End Time	Date and time the task instance ended.
Updated	Date and time that this task instance was last updated.

# **Activity Monitor Task Bar**

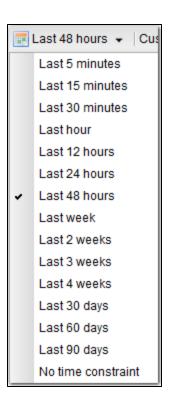

An Activity Monitor task bar displays across the top of the Activity Monitor, which allows you to select which task instances display on the Activity Monitor.

### **Time Constraint**

The Time Constraint drop-down list in the Activity Monitor Selections task bar allows you to select a time frame for which you want task instances to display on the Activity Monitor.

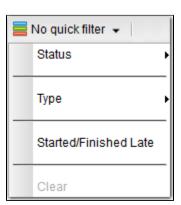

The default time constraint, as specified by the Activity Time Constraint user preference, is 48 hours.

### **Quick Filter**

The Quick Filter menu in the Activity Monitor Selections task bar allows you to filter the list with simple, pre-defined criteria so that only task instances matching that criteria within the selected Time Constraint and any selected Custom Filter display on the Activity Monitor.

To display the Quick Filter menu, click the Quick Filter button on the task bar which, by default, is identified as **No quick filter**.

The Quick Filter menu allows you to select any combination of the following filters to the list:

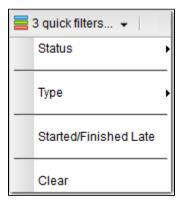

- Status: Individual task instance status and the following composite statuses:
  - Active = All task instance statuses except Skipped (180), Finished (190), Success (200).
  - Blocked = Waiting (10), Held (20), Exclusive Wait (23), Resource Wait (30), Execution Wait (33), and Action Required (60) task instance statuses.
  - Completed = Skipped (180), Finished (190), and Success (200) task instance statuses.
  - Problem = Undeliverable (35), Running/Problems (81), Cancel Pending (99), In Doubt (110), Start Failure (120), Confirmation Required (125), Cancelled (130), and Failed (140) task instance statuses.
- Type: Individual task type.
- Started/Finished Late: Task instance started and/or finish late according to the Start / Finish Late times specified in the task Details.
- Clear = Clears all Quick Filters from the list. (You can clear individual Quick Filters by deselecting them on the menu.)

#### Note

You can change the names of the composite statuses Quick Filters (Active, Blocked, Completed, and Problem), and the task instance statuses included in each one, by editing the System Default Activity Quick Filters Universal Controller system property.

You must select each Quick Filter individually; you cannot use Ctrl-click to select multiple Quick Filters. The Quick Filter button provides a count of how many Quick Filters have been applied to the list. For example, the following Quick Filter button shows that three separate quick filters have been applied.

The Clear button now is enabled, allowing you to remove all Quick Filters from the list in one click.

To see which Quick Filters have been applied to the list, hover your cursor over the Quick Filter button.

#### **Custom Filter**

The **Custom Filter** field and **Filter...** button in the Activity Monitor Selections task bar allows you to filter the list with complex, user-defined criteria so that only task instances matching that specified criteria within the selected Time Constraint and any selected Quick Filter display on the Activity Monitor.

See Filters for detailed information an applying and saving filters.

#### Refresh

The Refresh button enables you to perform a manual refresh of the information displayed on the Activity Monitor.

When you click the Refresh button, the button is disabled (the icon turns grey) until the refresh is complete. The Refresh button also is disabled if the Activity Monitor has not been started and is not monitoring activity.

## **Activity Monitor Display Task Bar**

An Activity Monitor Display task bar displays across the bottom of the Activity Monitor, which allows you to select which task instances on the Activity Monitor to view and how often the data for those task instances is refreshed.

### **Settings**

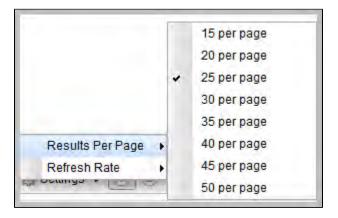

The Settings drop-down list provides the following selections:

Results Per Page

Refresh Rate

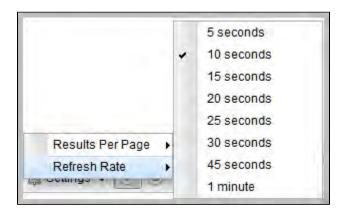

### **Results Per Page**

Hover your cursor Results Per Page on the Settings drop-down list to select the number of task instances to be displayed on a page (default is 25).

#### **Refresh Rate**

Hover tour cursor over Refresh Rate on the Settings drop-down list to select a refresh rate for the data displayed on the Activity Monitor (default is 10 seconds).

### **Start and Stop Activity Monitor**

Start and Stop buttons on the Activity Monitor allow you to start and stop the monitoring of activity on the Controller.

The Activity Monitor Automatically value specifies whether or not the Activity Monitor automatically is monitoring Controller activity.

You can override that value by electing either of the following, as appropriate:

### **Page Navigation Buttons**

Page navigation buttons allow you to scroll through the pages of task instances that are displayed according to the current Activity Monitor settings.

#### Note

You also can specify a specific page number to go to (see Page Numbering, below).

### **Page Numbers**

Page Numbers buttons in the task bar identify the number of the currently displayed page and the total number of pages.

You can go to a specific page number by clicking the ellipse (...) icon that displays after the current page number. A Go To Page pop-up displays.

Enter a page number and click the **Go** button to navigate to that page.

# **Displaying Task Instance Details**

To display Details for a specific task instance displayed on the Activity Monitor, click the Details icon next to the Instance Name of that task instance.

From the task Instance Details, you can also display additional Details about the task instance:

Show Metadata Displays Metadata for the task instance, including a status history.			
Show Details Displays complete database details for the task instance.			
Show Variables	Displays a list of all variables available to the task instance, including any variables inherited from the parent or embedded (sub-Workflow) Workflow of the task instance.		

# **Issuing Commands Against Task Instances**

Where applicable, you can manually intervene in processing by issuing a command against one or more task instances.

For information about the commands available for each type of task, see Supported Commands.

# **Monitoring Activity from the Task Instances List**

- Overview
- Displaying the Task Instances List
  - Task Instances List Column Descriptions
- Task Instances List Task Bar
  - Time Constraint
  - Filtering
- Displaying Task Instance Details
- Issuing Commands Against Task Instances

### Overview

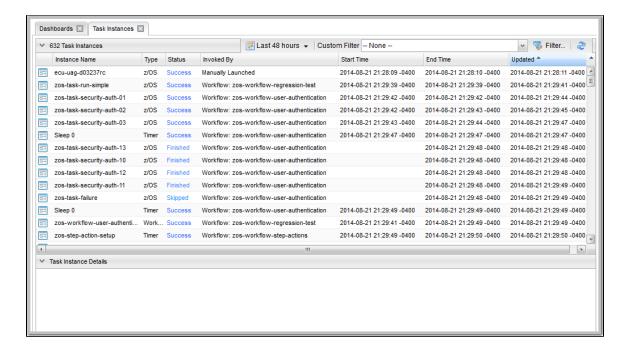

The Task Instances list displays the same task instance information as the Activity Monitor, but only for task instances for which there has been a status change or a modification to the task instance record.

Also, unlike the Activity Monitor, the Task Instances list is not automatically refreshed.

You also can monitor activity for a specific task by displaying task-specific Task Instances Details.

# **Displaying the Task Instances List**

From the Automation Center navigation pane, select Task Instances > All Task Instances. The Task Instances list displays.

### **Task Instances List Column Descriptions**

The following table describes the default columns of information displayed on the Task Instances list.

Column	Description			
Instance Name  Name of this task instance.				
Invoked By  System-supplied; how the task instance was launched. One of the following:  Trigger: (Trigger Name) - The instance was launched by the named trigger.  Workflow: (Workflow Name) - The instance was launched by the named workflow.  Manually Launched - The instance was launched by a user. To determine the name of the user.  Trom the Activity or Task Instances screen, click the task instance name to open the 2. The Execution User field identifies the user who launched the task instance.				
Start Time Date and time the task instance started.				
End Time	Date and time the task instance ended.			
Status Current status of the task instance.				

### **Task Instances List Task Bar**

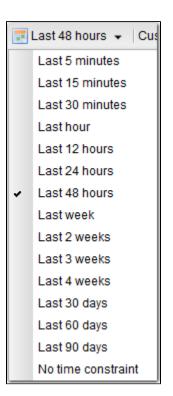

A Task Instances List task bar displays across the top of the Task Instances list, which allows you to select which task instances display on the list.

#### **Time Constraint**

The Time Constraint drop-down list in the Task Instance Selections task bar allows you to select a time frame for which you want task instances to display on the list.

The default time constraint, as specified by the Task Instances Time Constraint user preference, is 48 hours.

### **Filtering**

The **Custom Filter** field and **Filter...** button in the Task Instance Selections task bar allows you to filter the list so that only task instances matching the specified criteria within the selected time constraint display on the list.

See Filters for detailed information an applying and saving filters.

## **Displaying Task Instance Details**

To display Details for a specific task instance, either:

- Click the Instance Name of the task instance to display the Details below the list.
- Click the **Details** icon next to the **Instance Name** of the task instance to display a Details pop-up.

From the task Instance Details, you can also display additional Details about the task instance:

Show Metadata	Show Metadata Displays Metadata for the task instance, including a status history.	
Show Details Displays complete database details for the task instance.		
Show Variables	Displays a list of all variables available to the task instance, including any variables inherited from the parent or embedded (sub-Workflow) Workflow of the task instance.	

# **Issuing Commands Against Task Instances**

Where applicable, you can manually intervene in processing by issuing a command against one or more task instances.

For information about the commands available for each type of task, see Supported Commands.

# **Monitoring Activity History**

- Overview
- · Displaying the History List
- History List Task Bar
  - Time Constraint
  - Filtering
- Displaying History Details
  - History Details Field Descriptions

#### Overview

The History list (ops\_history) provides an historical display of all completed task activity. Only task instances with a status in an "end state" (SUCCESS, FINISHED, FAILED, CANCELLED, START FAILURE, SKIPPED) display in the History list.

The list allows you to track information about specific task instances, including multiple runs. For example, Task A may have failed and then was re-run by a user. This task instance will display twice on the History list, first for the time that it ran and failed and again for the time it was re-run to success.

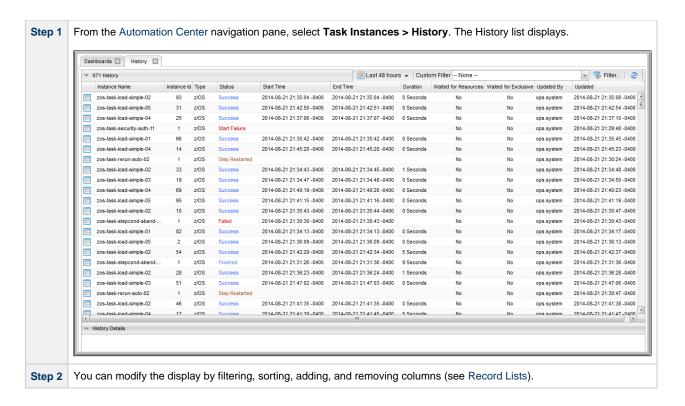

#### Note

If you want to display task activity for all tasks, for task instances in any status, and issue commands against those task instances, see the Activity Monitor and/or Task Instances list

If you want to display task activity for a specific task, for task instances in any status, and issue commands against those task instances, see the Viewing Task Instances for a Specific Task.

# **Displaying the History List**

### **History List Task Bar**

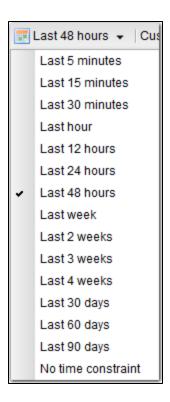

A History List task bar displays across the top of the History list, which allows you to select which task instances display on the list.

### **Time Constraint**

The Time Constraint drop-down list in the History List Selections task bar allows you to select a time frame for which you want task instances to display on the list.

The default time constraint, as specified by the History Time Constraint user preference, is 48 hours.

### **Filtering**

The **Custom Filter** field and **Filter...** button in the History List Selections task bar allows you to filter the list so that only task instances matching the specified criteria within the selected time constraint display on the list.

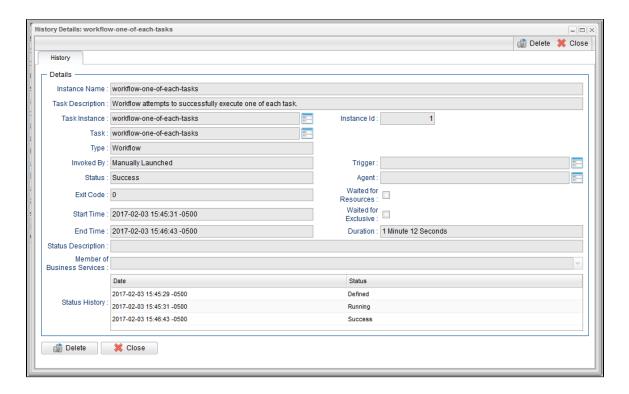

See Filters for detailed information an applying and saving filters.

# **Displaying History Details**

To display execution details about any task instance on the History list, either:

- Click anywhere in the task instance row to display the Details for that task instance below the list.
- Click the icon next to any **Instance Name** to display a pop-up version of the Details.

# **History Details Field Descriptions**

The following table describes the fields that display in History Details.

Field Name	Description	
Instance Name	Text field; Name of this task instance.	
Task Description  Description of this record. (Maximum = 200 characters.)		
Task Instance	Reference field; Name of this task instance. If the task instance is deleted, this field is empty.	
Instance Id	Controller-incremented number each time the task is run.	
Task	Name of the task that was run to create this task instance. Click the icon to display Task Details for the task.	
Туре	Type of task that was run to create this task instance.	
Universal Template	If Type = Universal; Name of the Universal Template on which the Universal Task Type is based.	

Invoked by	System-supplied; how the task instance was launched.			
	Options:			
	<ul> <li>Trigger: (Trigger Name)         Instance was launched by the named trigger.</li> <li>Workflow: (Workflow Name)         Instance was launched by the named workflow.</li> <li>Manually Launched         Instance was launched by a user. To identify the user, check the Execution User column for that task instance on the Task Instances screen or, on most task instance screens, the Execution User field.</li> </ul>			
Trigger	Name of the trigger that launched this task.			
Status	System-supplied; see Task Instance Statuses.			
Agent	Name of the Agent resource that identifies the machine where the operation will run. If you do not specify an Agent, you must specify an Agent Cluster.			
Exit Code	System-supplied; the exit code captured by the Agent when executing the task (for example, a command or script).			
Waited for Resources	Indication of whether or not the task instance ran only after it waited for a resource to become available.			
Start Time	System-supplied; Date and time the task instance started.			
Waited for Exclusive	Indication of whether or not the task instance ran only after it waited for one or more tasks with which it was mutually exclusive to finish.			
End Time	System-supplied; Date and time the task instance completed.			
Duration	System-supplied; amount of time the task instance took to run.			
Status Description	System-supplied; additional information, if any, about the status of the task instance.			
Member of Business Services	User-defined; allows you to select one or more Business Services that this record belongs to.			
Status History	History of statuses for this task instance.			

# **Viewing Task Instances for a Specific Task**

- Introduction
- Displaying Task Instance DetailsDisplaying Additional Task Instance Details
- Show Task Instance Variables
  - Show / Hide Global Variables

### Introduction

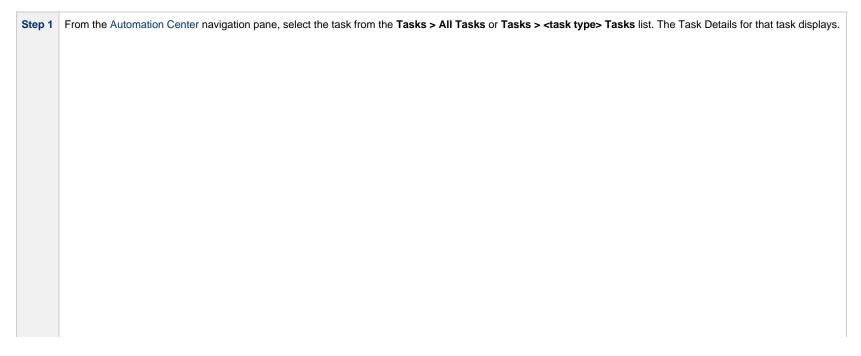

From the Task Details of any task, you can display a list of task instances for that task and the Details of any specific task instance.

The list will display all task instances for which there has been a status change or a modification to the task instance record within the last 30 days.

You also can display Details of any specific task instance from the:

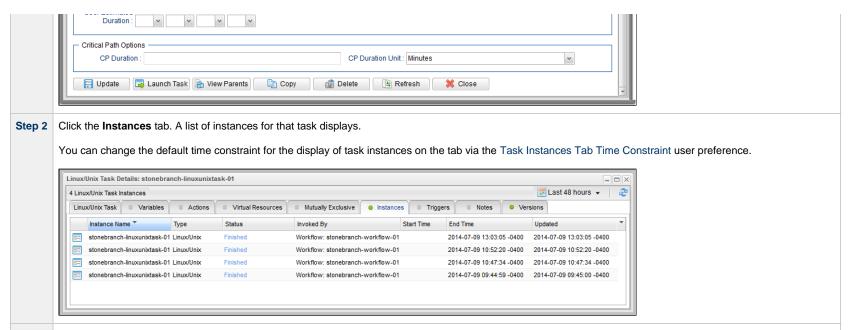

- Activity Monitor
- Task Instances list

# **Displaying Task Instance Details**

# **Displaying Additional Task Instance Details**

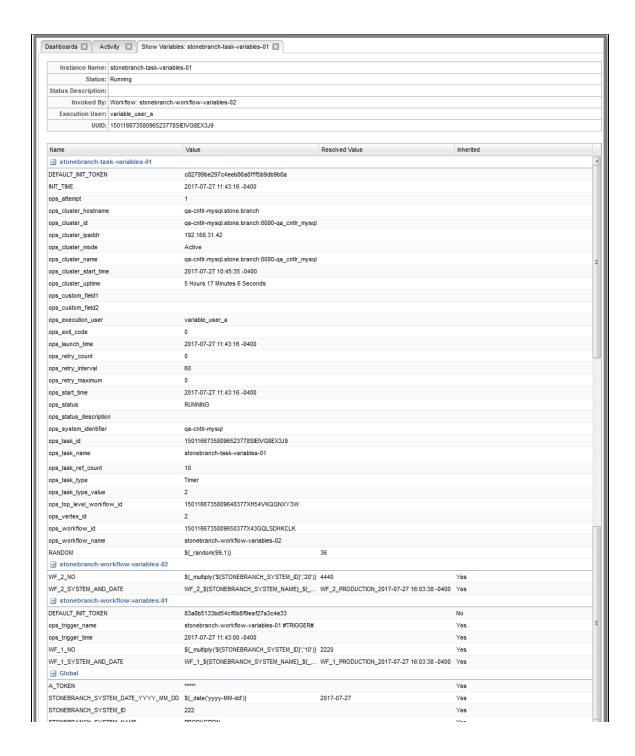

You can display additional Details for a task instance by right-clicking anywhere in the task instance to display an Action menu, and then selecting any of the following options from that menu:

Show Metadata Displays Metadata for the task instance, including a status history.			
Show Details Displays complete database details for the task instance.			
Show Variables	Displays a list of all variables available to the task instance, including any variables inherited from the parent or embedded (sub-Workflow) Workflow of the task instance.		

### **Show Task Instance Variables**

The Action menu for every task instance record Details contains a Details sub-menu. If you click Show Variables on this sub-menu, a Show Variables tab opens.

The Show Variables tab lists all variables available to the task instance. Variables inherited from the parent or embedded (sub-Workflow) Workflow of a task instance are listed in their own sections.

Field	Description			
Name	Name of the variable.			
Value	Value of the variable.			
	If the variable was defined by using the Variables tab on a trigger, task, or workflow (that is, a Local Variable), and it is a composite of other variables and/or functions, it will remain a composite of those variables and/or functions. Each time that variable is resolved, it will produce a dynamic resolution, which could differ from the previous resolution. The Resolved Value field will show what that variable would resolve to now.			
	For example: unique_id=\${ops_task_name}-\${ops_task_id}-\${ops_task_ref_count}-\${_date()}			
	If the variable was defined by using a Set Variable action for a task or workflow, and it is a composite of other variables, the value would be fully resolved.			
Resolved	If the variable is a composite of other variables and/or functions; value that the variable would resolve to now.			
Value	For example, using unique_id from the Value field, above: unique_id=stonebranch-task-variables-01-15011667358096523778SIEIVG8EX3J9-10-2017-07-27 16:03:38-0400			
Inherited	Indication (Yes or No) for whether a variable defined in the workflow hierarchy, or globally, would be inherited by the task instance.			
	For example, if the task instance already has that variable defined within its own scope, or within a more direct workflow scope, the variable would not be inherited.			
	(This field is not applicable for variables defined within the task instances own scope.)			
Buttons	This section identifies the buttons displayed below the list of variables.			
Print	Allows you to print the Show Variables table.			
Refresh	Refreshes the information in the Show Variables table.			
Show Global	Shows Global variables in the table.			
Hide Global	Hides Global variables in the table.			

### **Show / Hide Global Variables**

You can toggle the visibility of Global variables using the Show Global or Hide Global button.

By default (the Show Variables Fetch Global Automatically Universal Controller system property default is No), Global variables are not fetched and displayed automatically in the Show Variables tab, since there could be a large number of Global variables, and only a few (or none) could be relevant to a specific task instance.

Furthermore, you may want to use the Set Variable action on a workflow in Defined status to populate the workflow instance with its own variables generated from Global variables, which often can be date/time related functions that need to be resolved at Trigger/Launch time.

Any user can change the default visibility of Global variables by using the Show Variables Fetch Global Automatically User Preference.

The following constraints apply when viewing Global variables from Show Variables.

- The task instance can only use (or Read) global variables for which the task instance Execution User has Variable Read permission for, therefore, the report will only display those global variables.
- If the user running the Show Variables report does not have Variable Read permission for a global variable in the report, the Value field will be masked with \*\*\*\*\*.
- If the user must be able to view a global variable value from the report, an administrator must grant the user the appropriate Variable Read permission.

# **Displaying Task Instance Status**

- Displaying Task Instance Status
- Task Instance Status Types
  - Agent-Based Task Types
- Task Instance Status Colors

# **Displaying Task Instance Status**

You can display the status of one or more task instances from the Activity Monitor, Task Instances list, History list, or Command Line Interface (CLI).

Activity Monitor	To display the status of one or more task instances on the Activity Monitor:  1. From the Automation Center navigation pane, select <b>Task Instances &gt; Activity</b> . The Activity Monitor contains a <b>Status</b> column that identifies the current status of every task instance on the list.
Task Instances list	To display the status of one or more task instances on the Task Instances list:  • From the Automation Center navigation pane, select <b>Task Instances &gt; All Task Instances</b> . The Task Instances list contains a <b>Status</b> column that identifies the current status of every task instance on the list.
History list	To display the status of one or more task instances on the History list:  • From the Automation Center navigation pane, select <b>Task Instances &gt; History</b> . The History list contains a <b>Status</b> column that identifies the current status of every task instance on the list.
Command Line Interface (CLI)	To display the status of one or more task instances from the Command Line Interface:  • Use the ops-task-status function.

# **Task Instance Status Types**

The following table describes all possible task instance statuses for all task types.

For a list of commands that you can issue against a task instance in each status, see Commands Supported for Task Instance Statuses.

For a description of each command, see Issuing Commands Against Task Instances.

#### Note

The format of multi-word task status names used in the Controller user interface differs from the format of task status names specified in the Display Task Instance Status CLI function. In the user interface, they are separated by a space; in the Display Task Instance Status CLI function, the words are separated by an underscore character.

Status Code	Status Name	Task Type	Description
0	Defined	All	The new task instance has been created (the task has been launched).
10	Waiting	All	The task instance has been loaded by a workflow and is waiting on a predecessor.
15	Time Wait	All (except Timer)	The task instance is waiting to start based on a Wait To Start and/or Delay On Start specification.
20	Held	All	The task instance has been put on hold by a user.
22	Exclusive Requested	All	All task instances with a mutually exclusive task defined go immediately to a status of Exclusive Requested. If the task instance is available to run exclusively, the task instance then moves to the next appropriate processing status.
23	Exclusive Wait	All	The task instance is mutually exclusive with one or more other task instances, and it is waiting for those task instances to finish before it will run.
25	Resource Requested	All	All task instances with a virtual resource defined go immediately to a status of Resource Requested. If the resource is available, the task instance then moves to the next appropriate processing status.
30	Resource Wait	All	All task instances with a virtual resource defined go immediately to a status of Resource Requested. If the resource is not available, the task instance goes to a status of Resource Wait. When the resource becomes available, the task instance moves to the next appropriate processing status.
33	Execution Wait	Agent-based	The task instance must wait to be completed; either the Agent/Agent Cluster running the task instance has reached its Task Execution Limit, or the ability of the Agent/Agent Cluster to run tasks has been suspended.
35	Undeliverable	Agent-based	The Agent is unavailable.
40	Queued	Agent-based	The task instance has been queued on a resource.
43	Submitted	z/OS	The task instance has been submitted to the z/OS Job Entry subsystem and scheduled by the z/OS Job Scheduler.
45	Step Restarted	z/OS	The task instance has been re-run starting from a specific z/OS jobstep.
60	Action Required	Manual	When a Manual task launches, the task instance goes into Action Required status, meaning a user must perform some manual activity. For details, see Manual task.
70	Started	Agent-based, Manual	The task instance has started. For Agent-based tasks, this means the Agent has received the task.
80	Running	All	The task instance is running. For Agent-based tasks, the Agent has started running the program.

81	Running/Problems	Workflow	One or more task instances within the workflow has one of the following statuses:
			<ul> <li>Cancelled</li> <li>Confirmation Required</li> <li>Failure</li> <li>In Doubt</li> <li>Running/Problems (for sub-workflows)</li> <li>Start Failure</li> <li>Undeliverable</li> </ul>
99	Cancel Pending	Agent-based	A process running on the Agent needs to be terminated. When the Cancel command is issued, the task instance will go into a Cancel Pending status until the Agent reports back that the process has been cancelled. At that point, the task instance will transition into the Cancelled status.
110	In Doubt	Agent-based, SQL, Stored Procedure, Web Service	The task instance is "in doubt" about the current status of the job. This may occur if an Agent or Agent connection goes down. In this case, the Agent restarts and reviews its data about task instances in progress. If the Agent finds a task instance still running, it resumes normal monitoring. If the Agent cannot find the task instance, this usually indicates that the task instance completed, but the Agent considers the task instance status to be "in doubt."  When the Controller restarts, any SQL, Stored Procedure, and Web Service task instances that are in a Running status will transition into the In Doubt status, since the Controller no longer has any knowledge of them.
120	Start Failure	All	The task instance was unable to start.
125	Confirmation Required	z/OS	If you make JCL changes and restart a z/OS task instance, Universal Controller will put the task instance into Confirmation Required status and prompt you for a confirmation. For detailed processing steps, see Rerunning a z/OS Task.
130	Cancelled	All	The task instance was cancelled by a user.
140	Failed	All (except Workflow)	The task instance ran to a failure status.
180	Skipped	All	The task instance was skipped by Run/Skip criteria, an Execution Restriction, or the Skip command.
190	Finished	All	The task instance was forced by the user to finish. The user may do this in cases where the task instance had a Cancelled or Failed status, and the user needed to release other task instances depending on the successful completion of this task instance in a workflow. For more information, see Force Finishing a Task.
200	Success	All	The task instance has completed successfully. Workflows will transition to Success status when all of its task instances have transitioned to Success, Finished, or Skipped status.

# **Agent-Based Task Types**

The following task types are Agent-based task types:

- Linux/Unix
- Windows
- z/OS
- Universal Command
- SAP
- PeopleSoftFile TransferFile Monitor

- FTP File MonitorSystem MonitorUniversal

## **Task Instance Status Colors**

You can change the default color assigned to each task instance status via the Colors, in the Reporting navigation pane.

# **Retrieving Output**

- Overview
- Retrieve the OutputRetrieve Output Field Descriptions

### **Overview**

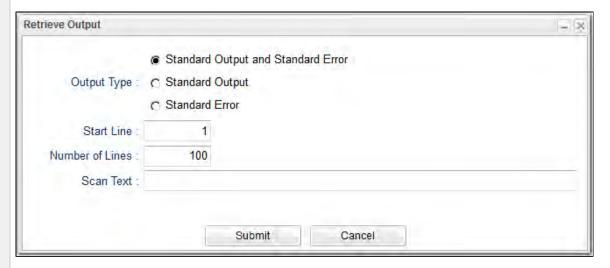

For any running or completed task where output (for example, standard out and/or standard error) has been generated and you did not specify that output be automatically retrieved, you can instruct Universal Controller to retrieve the output.

# **Retrieve the Output**

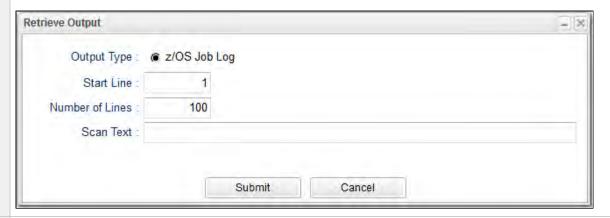

Step 1 From the Automation Center navigation pane, select Task Instances > Activity or Task Instances > Task Instances to display the Activity Monitor or Task Instances list.

**Step 2** Display the task instance Details for the task whose output you want to retrieve.

Step 3 Access the Action menu. If output is available for the task instance, click Retrieve Output.... The Retrieve Output dialog displays.

If the selected task is a z/OS task, the Retrieve Output dialog contains a single **Output Type** selection:

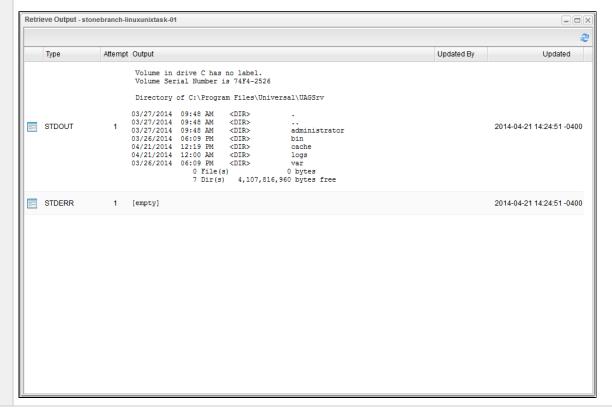

Step 4 Using the field descriptions below as a guide, make your selection. Positioning can be accomplished by using Start Line or Scan Text fields to see the Number of Lines both before and after the first match of text.

#### Note

If you want to retrieve data starting at the end of a file, enter -1 in the Start Line field and the number of lines to retrieve in the Number of Lines field.

Step 5 Click the **Submit** button. The Controller retrieves the output you specified and displays a Retrieve Output pop-up containing the requested type of output. (It also writes the output to the **Output** tab of the task instance.)

# **Retrieve Output Field Descriptions**

Field Name	Description
Standard Output and Standard Error	Retrieve both standard output and standard error information returned by the program.
Standard Output	Retrieve standard output only.
Standard Error	Retrieve standard error output only.
z/OS Job Log	Z/OS tasks only; Retrieve information from the z/OS job log.
Start Line	Retrieve data beginning at the line indicated.
	<ul> <li>If a Start Line value is not specified in the task instance Details, the default is 1.</li> <li>If the Start Line value is -1, data will be retrieved starting at the end of the file.</li> </ul>

Number of Lines	Limit the retrieved data to the <b>Number of Lines</b> value in the task instance Details. If a <b>Number of Lines</b> value is not specified, default is the value of the Retrieve Output Default Number Of Lines Universal Controller system property.	
Scan Text:	Regex pattern that the Controller will search for a match for in STDOUT/STDERR (or z/OS job log). The Controller will include the Number of Lines above and below the first line matched.	
	if the Regex pattern is not found, the following message is returned: OPSWISE WARNING - Scan text string not found.
