Getting Started with
Universal Command for SOA: XD Connector
4.2.0

Objective

The objective of this document is to assist in the following activities regarding the Universal Command for SOA: XD Connector:

- Installing Universal Command for SOA.
- Validating the WebSphere environment.
- Running the XD Connector on Universal Command for SOA.

Installation Requirements

The following is required for running Universal Command for SOA with an XD Connector:

- Stonebranch Solutions 3.2.0.1 or later: installed, licenses, and running.

Installation

Universal Command for SOA 4.2.0 is packaged as an RPM file (extension .rpm). It is installed using the Linux **rpm** command.

The name of the Universal Command for SOA package file has the following format:

sb-soa-4.2.0.0-linux-2.4-i386.tar.Z

(The name assumes product maintenance level 4.2.0.0 for Universal Command for SOA.)

The following steps describe the unpacking and installation of Universal Command for SOA 4.2.0:

1. Create a directory (or select an existing directory) in which to save the package file.
2. Save the package file into that directory.
3. Uncompress and extract the installation files in the current working directory. The command to extract the files is:

   zcat sb-soa-4.2.0.0-linux-2.4-i386.tar.Z | tar xvf -

   If your operating system does not support the **zcat** command, use the following command:

   gunzip sb-soa-4.2.0.0-linux-2.4-i386.tar.Z

   The output of the gunzip command provides the following **tar** file:

   tar –xvf sb-soa-4.2.0.0-linux-2.4-i386.tar

Customer Support: North America (+1) 877 366-7887 ext. 6 [toll-free] ● Europe +49 (0) 700 5566 7887
support@stonebranch.com

uca-xd-quickstart-4200   copyright ©2010 Stonebranch, Inc.

4. After the extraction is complete, run the installation script, ups**inst**, which executes the **installp** command:

   `./upsinst`

   An installation log is written to file **install.log** in the current directory. **upsinst** automatically restarts the Universal Broker daemon, **ubrokerd**, at the end of the install.

5. You can use **uquery** (cd to **/opt/universal/bin**) to validate that Universal Command for SOA 4.2.0 is running.

   uquery –i localhost (or the name of your server)

   The output should have the following format:

```
Component ID................: 1206554190
Component Name..............: uac (Server)
Component Description.......: Universal Application Container Server
Component Version...........: 4.2.0 Level 0 Development Build 284
Component Type..............: uac
Component Process ID........: 27070
Component Start Time........: 01:56:29 PM
Component Start Date........: 03/26/2010
Component Command ID........: uac
Component State.............: REGISTERED
Component MGR UID...........:
Component MGR Work ID.......:
Component MGR Host Name.....:
Component MGR IP Address....:
Component MGR Port..........:
Component Comm State........: STARTING
Component Comm State Time.: 01:56:29 PM
Component Comm State Date.: 03/26/2010
Component MGR Restartable.: NO
Component Comment...........:
```

6. From the license file that was sent to you by Stonebranch, Inc., add the license information to the **/etc/universal/uacs.conf** file.

7. Recycle u**broker** using the following commands (cd to **/opt/universal/ubroker**):

   a. `./ubrokerd stop`

   b. `./ubrokerd start`

8. Again, you can use **uquery** (cd to **/opt/universal/bin**) command to validate that Universal Command for SOA 4.2.0 is running after updating the **uacs** configuration file.

   uquery –i localhost (or the name of your server)

Validating the WebSphere XD Environment

To ensure trouble free operation of the Universal Command for SOA: XD Connector 4.2.0, the WebSphere XD environment must be set up correctly.

The following areas should be addressed before using the Universal Command for SOA: XD Connector 4.2.0.

1. **Application Security**

   After installing the XD environment application, security must be enabled (if it is not on by default).

   Select **Security** / **Secure administration, applications, and infrastructure** in the Integrated Solutions Console menu. Check the **Enable application security** checkbox in the Application Security group.

2. Map Users to Job Scheduler

Users that have been set up in WebSphere must be mapped to a user in the job scheduler before they can run operations in the job scheduler.

Select **System administration** / **Job scheduler** in the Integrated Solutions Console menu. Click on the **Security role to user/group mapping** link in the Addition Properties group.
Clicking on the link takes you to the Security role to user/group mapping page.

Here you can assign WebSphere users to `lrsubmitter` or `lradmin` (or other job scheduler users if you have created them). Make sure the **All authenticated?** checkbox is checked.

The following screen illustrates the results of mapping the WebSphere user `admin` to the `lrsubmitter` job scheduler user.
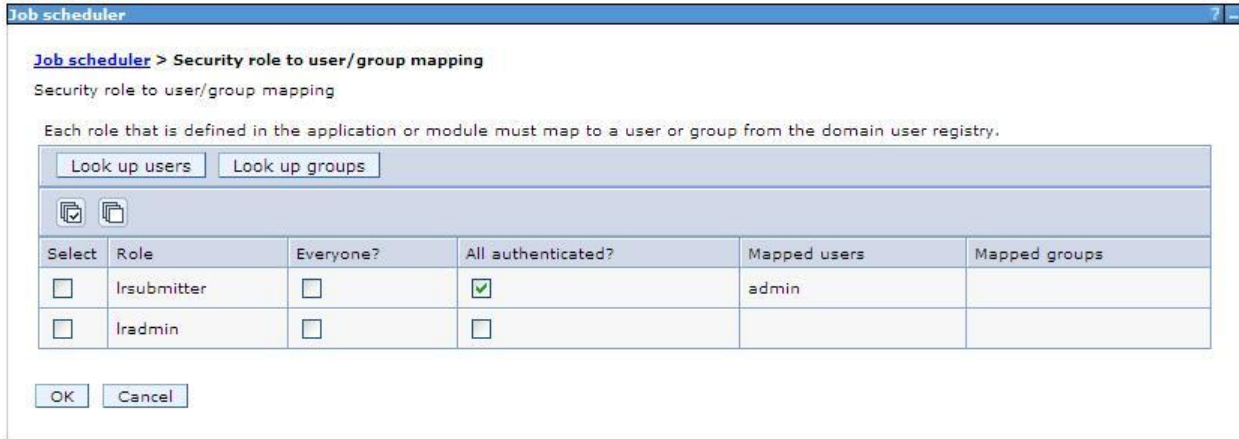

3. Install the Job Scheduler Sample Applications

You must install the SimpleCIEar and PostingsSampleEar applications if you want to validate the WebSphere XD installation and the Universal Command for SOA: XD Connector operation.

Go to **Applications** / **Install New Applications** in the Integrated Solutions Console menu. Keep in mind that the PostingsSampleEar application requires the database to be setup before you install the application.

The following screen illustrates the two applications after they are installed.
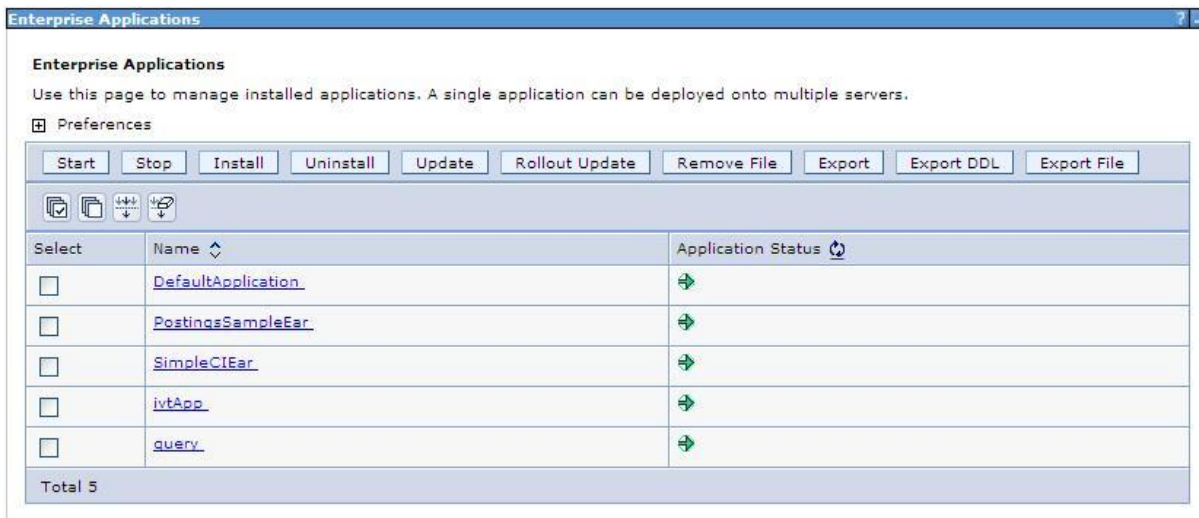

4. **Run Sample Applications using `lrcmd.sh` Utility**

    Now that you have successfully installed the sample applications, you can test that your WebSphere XD environment is set up correctly by running the applications using the `lrcmd.sh` utility.

    a. The `lrcmd.sh` utility is located in `/opt/IBM/WebSphere/AppServer/bin` or where your local WebSphere installation path points to the `bin` directory.

    b. The command syntax for submitting a job using `lrcmd.sh` is:

    ```
    ./lrcmd.sh –cmd=submit –
    xJCL=/opt/IBM/WebSphere/AppServer/longRuning/postingSampleXJCL.xml –
    host=localhost –port=9080 –userid=yourusername –password=yourpassword
    ```

    Note that for the SimpleCIEar application, the xJCL is named SimpleCIxJCL.xml and host can be the name of any server on which WebSphere is installed.

    The response to the submit command is shown below.

    ```
    CWLRB4960I: Fri Mar 28 15:20:43 EDT 2010 : com.ibm.ws.batch.wsbatch : Job [Posti
    ngsSampleEar:18] is submitted.
    ```

    c. When you have submitted the job, you can check its status by using the Job Management Console through your favorite web browser at:

    https://yourservername:9443/jmc/console.jsp

    d. When you have submitted the job, run the `status` command.

    The syntax for using the status command is:

    ```
    ./lrcmd.sh –cmd=status –jobid=PostingsSampleEar:1 –host=localhost –
    port=9080 –userid=yourusername –password=yourpassword
    ```

    The response to the status command is shown below:

    ```
    CWLRB5160I: Fri Mar 28 15:24:46 EDT 2010 : Job [PostingsSampleEar:18] execution
    has ended.
    ```

Running a Universal Command for SOA Job on z/OS Connecting to XD Connector

You now can run jobs in WebSphere XD using the Universal Command for SOA: XD Connector.

The following z/OS examples reference the PostingsSampleEar application.

1. **Create the UMCD Manager JCL.**

   This provides the UCMD Manager options, references to the XD Connector options, and the xJCL payload.

   It has the following format:

```
//UACXD1A  JOB CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
//*
//***********************************************************
//*PostingsSampleEar
//*UCMD is the proc that calls UC Manager
//*LOGON is the DD with userid and passwd (can use encrypted)
//*SCR is the script that contains the XD Connector information //* to
connect to Websphere job scheduler
//*UNVIN provides the payload for the script in SCR
//***********************************************************
//*
//          JCLLIB ORDER=SBI.UNV.SUNVSAMP
//*
//UCMD      EXEC UCMDPRC
//LOGON     DD  DISP=SHR,DSN=SUPPORT.UAC.LOGON(YOURUSER)
//SCR       DD  DISP=SHR,DSN=SUPPORT.UAC.SCRIPTS(SCRXD1)
//UNVIN     DD  DISP=SHR,DSN=SUPPORT.UAC.SCRIPTS(PYLXD1)
//SYSIN     DD  *
-s scr -script_type service
-i yourserver -G yes -f logon
```

support@stonebranch.com

uca-xd-quickstart-4200   copyright ©2010 Stonebranch, Inc.

2. **Create the XD Connector Command Options Data Set Member.**

   This member contains the command options for the XD Connector that specify the required information to submit a job to the WebSphere XD environment.

   It is referenced with the **SCR** ddname and has the following format:

```
# protocol is what protocol you are choosing(XDSOAP)
# mep is the type of message (Request)
# xdcmd is the xd command you want to perform (submit,restart)
# cmdid is a unique identifier to match to jobid(websphere jobid)
# serviceurl is the websphere url to the job scheduler
# serviceusername is the websphere user
# servicepassword is the websphere user password
# timeoutms is the timeout in milliseconds for the job
#************************************************
-protocol XDSOAP
-mep Request
-xdcmd SUBMIT
-cmdid 10010
-serviceurl http://sup-
wasxd:9080/LongRunningJobSchedulerWebSvcRouter/services/JobScheduler
-serviceusername admin
-servicepassword admin
-timeoutms 120000000
```

3. **Create the xJCL Payload Data Set Member**.

   This member contains the xJCL that WebSphere XD will use to run the job specified in the xJCL and is read via STDIN.

   The xJCL length depends on the job it describes. Verify that your data set member record length can accommodate the maximum line length in your xJCL.

   The xJCL is an XML document. It is referenced using the UNVIN ddname, and can be referenced in your WebSphere XD install by going to:

   /opt/IBM/WebSphere/AppServer/longRunning/postingSampleXJCL.xml

   (Your path may be different, depending on how you configured your WebSphere XD install.)
