## **Universal Agent 6.3.x Maintenance**

#### Introduction

Universal Agent 6.3.x consists of a family of components that address distributed systems management and automation. The components are packaged together as product installation packages. Product installation packages are provided for a variety of operating systems and hardware.

Stonebranch provides product maintenance in the form of updated product installation packages that contained the latest maintenance levels of product components. These pages list the product installation package and component maintenance history for Universal Agent 6.3.x.

### **Product Packaging**

Agent components are bundled together into product installation packages, referred to simply as packages in this document. Each package is identified with a package version number and each component within a package is identified with a component version number.

Each package and component maintenance level is identified with a version number (see Versioning, below). The component maintenance level is incremented whenever a new component is made available that contains defect fixes or feature enhancements. A package maintenance level is incremented when a product component within the package changes or the package installation changes.

Package maintenance levels are not necessarily made available for all platforms. Package maintenance may be released for a subset of supported platforms. For example, Universal Agent 6.3.0 for z/OS and UNIX may be at maintenance level 6.3.0.1, but Universal Agent 6.3.0 for Windows may be at 6.3.0.0.

Stonebranch changes product version, release, or modification identifiers at its discretion when it deems an appropriate number of enhancements or capabilities have been introduced to warrant the change.

#### Versioning

Package version numbers are comprised of four numeric identifiers: version, release, modification level, and maintenance level.

For example, for Universal Agent 6.3.0.1:

- 6 = Version 6
- 3 = Release 3
- 0 = Modification Level 0
- 1 = Maintenance Level 1

Product component version numbers are similar to the package version numbers. Each product component within the package is identified with the same version, release, and modification level as the package, and with a maintenance level that is independent of the maintenance level of the package or other components in the package.

For example, within a Universal Agent 6.3.0.1 package, there could be a Universal Command 6.3.0.0 component:

- 6 = Version 6
- 3 = Release 3
- 0 = Modification Level 0
- 0 = Maintenance Level 0

### **Packaging Methods**

Packaging methods vary among platforms based on the installation conventions and vendor recommendations for the platform. The purpose of this section is to describe the packaging and distribution methods used for the Workload Automation package on its supported platforms.

z/OS	The Universal Agent 6.3.0 package is an SMP/E install consisting of multiple FMIDs. The package is composed of a set of FMIDs for MVS components and a set of FMIDs for UNIX System Services (USS) components. The MVS components are required and the USS components are optional.
	Maintenance is packaged as a cumulative PTF file containing all available product PTFs for all products within the Workload Automation package.
Windows	All packages are created with the InstallShield Windows packaging tool. The package is installed with Microsoft's Windows Installer (file extension .msi).
	Product maintenance is packaged as an updated Windows Installer installation package. The installation process upgrades the current install to the latest product maintenance level.
UNIX	There are two installation methods supported on UNIX platforms, both of which are initiated from a Stonebranch script:
	<ul> <li>A system installation uses the UNIX package management system to install the product in vendor-recommended installation directories.</li> <li>A user mode installation method is performed outside of the UNIX package management system. It allows installation of the product in user-selected directories, and supports multiple installs of differing versions or the same versions of the product.</li> </ul>
	Product maintenance is packaged as an updated installation package. The installation process upgrades the current installation to the latest product maintenance level.
	UNIX vendor system installation formats are as follows:
	<ul> <li>AIX is packaged in a backup file format (extension .bff) and installed with the AIX installp command.</li> <li>Sun Solaris is packaged in a Sun software package format and installed with the Sun pkgadd command.</li> <li>HP-UX is packaged in a HP depot format and installed with the HP swinstall command.</li> <li>Linux is packaged in a RPM format and installed with the Linux rpm command.</li> <li>All other UNIX varieties are packaged as compressed tar files and installed with the Stonebranch UNIX installation scripts.</li> </ul>
IBM i	The package is an IBM i Licensed Program and installed with the IBM i RSTLICPGM command. By default, all product and dependent product identifiers are installed.
	Maintenance is packaged as a cumulative PTF file containing all available product PTFs.
НР	On the HP NonStop platform, Universal Command 2.1.1 product is packaged by itself. No other products are included in the distribution file.
NonStop	The package is installed with a Stonebranch OBEY file.
	Product maintenance is packaged as an updated installation package. The installation process upgrades the current install to the latest product maintenance level.

### Release 6.3.0.6 - May 24, 2017

Change ID	Platform	Component	Description
B-07352	z/OS	UAGSRV UAGUJI UAGUJV	Extend timeouts for acquiring exclusive access to the JSC dataset ENQUEUE.
B-07353	z/OS	UAGSRV	Extend timeouts for JME creation when launching a z/OS task.
D-07174	UNIX, Windows	UAGSRV	Format the Is command used for an SFTP File Monitor to use the –I (minus "el") option instead of -1 (minus one) to prevent errors on SFTP servers that do not recognize the -1 (minus one) option.
D-07296	Windows	UAGSRV	Prevent a situation that may result in a "CSProcessCreate: The system cannot find the file specified" error when several Windows tasks that execute scripts with user credentials are launched at once.

D-07559	All	UDM, UDMSRV	Fix a problem that could cause Universal Data Mover to prematurely stop reading a UTF16-encoded file.		
			Note The problem was observed when trying to transfer a UTF-16BE file to a zOS dataset encoded with the IBM500 codepage. The cause of the problem was related to the size of the input file, and not to the UTF16 translation itself.		
D-07562	z/OS	UAGUJV UAGUSI	Prevent a conflict with a customer SMF exit that references the same JMR control block locations as UAGSRV SMF exits.		
D-07563	z/OS	UAGUJI	Fix a problem that prevents steps containing a DD statement which specifies DSN=NULLFILE to be selected for restart.		
D-07564	z/OS	UAGUJI	Make sure SKIPST parameters specified for z/OS tasks correctly skip steps that execute PROCs.		
D-07566	Windows	Install	Fix a problem that could cause a silent install to fail when RUNBROKERASUSER=0 is specified. The install incorrectly tried to authenticate the default credentials for a Broker service account whose password had been changed. The authentication failure was ignored for interactive installs, but caused silent installs for fail.

### Agent 6.3.0.6 - May 24, 2017

Change ID	Platform	Component	Description						
D-07174	UNIX, Windows	UAGSRV	mat the Is command used for an SFTP File Monitor to use the -I (minus "el") option instead of -1 (minus one) to prevent errors on SFTP servers that do recognize the -1 (minus one) option.						
D-07296	Windows	UAGSRV	vent a situation that may result in a "CSProcessCreate: The system cannot find the file specified" error when several Windows tasks that execute pts with user credentials are launched at once.						
D-07559	All	UDM, UDMSRV	Fix a problem that could cause Universal Data Mover to prematurely stop reading a UTF16-encoded file.						
			Note The problem was observed when trying to transfer a UTF-16BE file to a zOS dataset encoded with the IBM500 codepage. The cause of the problem was related to the size of the input file, and not to the UTF16 translation itself.						
D-07566	Windows	Install	Fix a problem that could cause a silent install to fail when RUNBROKERASUSER=0 is specified. The install incorrectly tried to authenticate the default credentials for a Broker service account whose password had been changed. The authentication failure was ignored for interactive installs, but caused silent installs for fail.

#### Note

The number of maintenance items delivered for the 6.3.0.x Universal Agent has resulted in a unusually large cumulative PTF for the 6.3.0.4 release. Because of this, the Stonebranch-default #HLQ.UNV.SMP.SMPPTS dataset created by the UNVIN01 install job with an allocation of (TRK,(4500,150,50)) may not be large enough to hold new PTFs.

Whether you're using this particular PDS, or one of your own, we recommend that it now have a primary allocation of 8000 tracks in order to accommodate current and future PTFs. If your dataset is smaller than this, copy your existing dataset, allocate a new one with the larger allocation, and restore it from the backup prior to applying 6.3.0.4 maintenance.

CR01137	HP NonStop	UCOPY	UCOPY always created files with file code 180. UCOPY is now capable of creating Guardian EDIT files as well as C files (180).
DF01060	HP NonStop	UBROKER	The ubrokerd script with the status argument only worked if run with the same user identifier as the broker is executing. Any user can now successfully execute the status command.
DF01325	HP NonStop	UBROKER	Broker log file permission was set so that only the user identifier with which the broker is running could read it. This identifier is normally super.super. File permissions are now set so everyone can read them.
DF01326	HP NonStop	UCMSRV	Server trace file permission was set so that only the user identifier with which the broker is running could read them. This identifier is normally super.super. File permissions are now set so everyone can read them.

## 2.1.1.1 - September 30, 2003

Change ID	Platform	Component	Description
CR01023	HP NonStop	UCMSRV	Added the server options CPU and PRIORITY. The CPU option permits a UCMD manager to specify the processor on which the user job executes. The PRIORITY option permits a UCMD manager to specify the priority with which the user job executes. The UCMD manager can specify both options with the manager's SERVER option (-S or –server).
DF01000	HP NonStop	UCMSRV	Standard input redirection was enabled.
			Changed the UCOPY program from a Guardian program to an OSS program to prevent gtacl from manipulating the data transferred in binary mode.
			Added the UCMD server option SCRIPT_TYPE in order to support both TACL and OSS commands and scripts. The UCMD manager can specify the option with the manager's SERVER option (-S or –server).

DF01027	HP NonStop	UBROKER	The time values printed in the UCMD messages were not correct. The C run-time library's TZ environment variable controls time values be specifying the time zone for the program. The TZ environment variable has been added to the UBROKERD startup script.
