Universal Command Agent for SOA 6.3.x

MQ Connector

Getting Started with Universal Command Agent for SOA - MQ Connector 6.3.x

Objective

The objective of this document is to assist in the following activities regarding the Universal Command Agent for SOA: MQ Connector:

- Installing Universal Agent for SOA 6.3.x, which is comprised of:
  - Universal Command Agent for SOA
  - Universal Event Monitor for SOA
- Running Universal Command Agent for SOA with an MQ Connector.

Installation Requirements

The following is required for running Universal Command Agent for SOA with an MQ Connector:

- Universal Agent 6.2.0.0 or later (32-bit package); installed, licensed, and running.
- MQ Environment version 6 or later, with working queues.
- MQ Client jar files for native communication to MQ must be in the following path:

```
/opt/universal/uac/container/webapps/axis2/WEB-INF/lib

com.ibm.mq.commonservices.jar
com.ibm.mq.jar
com.ibm.mq.pcf.jar
com.ibm.mq.headers.jar
com.ib.mq.jmqi.jar
connector.jar
```

The MQ Client for Java version 7.0 package with the latest fix pack is recommended.

When using a MQ CCDT to establish connections to queue managers, 7.0.1.3 or later is highly recommended.

Installation

> ⚠️ **Note**
> These instructions describe installation of the Universal Agent for SOA 6.3.x for AIX package.

Universal Agent for SOA 6.3.x is packaged as a compressed tar file.

The name of the Universal Agent for SOA 6.3.x package file has the following format:

sb-soa-6.2.0.0-aix-5.3.tar.Z

(The name assumes product maintenance level 6.2.0.0 for Universal Agent for SOA 6.3.x.)

To unpack and install Universal Agent for SOA, perform the following steps:

Step 1	Create a directory (or select an existing directory) in which to save the package file.
Step 2	Save the package file into that directory.
Step 3	Uncompress and extract the installation files in the current working directory. The command to extract the files is: ``` zcat sb-soa-6.2.0.0-aix-5.3.tar.Z	tar xvf - ``` If your operating system does not support the **zcat** command, use the following command: ``` gunzip sb-soa-6.2.0.0-aix-5.3.tar.Z ``` The output of the **gunzip** command provides the following **tar** file: **tar -xvf sb-soa-6.2.0.0-aix-5.3.tar**
Step 4	After the extraction is complete, run the installation script, **upsinst**, which executes the **installp** command: ``` ./upsinst ``` An installation log is written to file **install.log** in the current directory. **upsinst** automatically restarts the Universal Broker daemon, **ubrokerd**, at the end of the install.
Step 5	From the license file that was sent to you by Stonebranch, Inc., add the license information to the following file: **/etc/universal/uacs.conf**
Step 6	Recycle Universal Broker using the following commands (cd to **/opt/universal/ubroker**) First: ``` ./ubrokerd stop ``` Then: ``` ./ubrokerd start ```

Step 7	Use Universal Query (cd to `/opt/universal/bin`) to validate that the Universal Application Container Server component of Universal Command Agent for SOA 6.3.x is running:
	`uquery -host localhost` (or the name of your server)
	The output should have the following format:

```
Component ID..............: 1360109684
Component Name............: uac (Server)
Component Description.....: Universal Application Container Server
Component Version.........: 6.3.x Level 0 Release Build 101
Component Type............: uac
Component Process ID......: 23331000
Component Start Time......: 18:14:42
Component Start Date......: 02/05/15
Component Command ID......: uac
Component State...........: REGISTERED
Component MGR UID.........:
Component MGR Work ID.....:
Component MGR Host Name...:
Component MGR IP Address..:
Component MGR Port........:
Component Comm State......: ESTABLISHED
Component Comm State Time.: 18:14:44
Component Comm State Date.: 02/05/15
Component MGR Restartable.: NO
Component Comment.........:
```

MQ Environment Verification

Verify that you have a working MQ environment. You must define the following MQ values, as these are needed for the Universal Command Agent for SOA jobs that you will submit: queuemanager, queuename, and channel.

You now can run jobs in MQ using the Universal Command Agent for SOA: MQ Connector.

Running a Universal Command Agent for SOA Job on z/OS Connecting to MQ Connector

Step 1	Create the UCMD Manager JCL. This provides the UCMD Manager options, references to the MQ Connector options, and the payload. It has the following format:

```
//XXXXXXXX JOB CLASS=A,MSGCLASS=X,NOTIFY=&SYSUID
000002 //*
000003 //************************************************************
000004 //*MQ queue test for Publish
000005 //*UCMD is the proc that calls UC Manager
000006 //*LOGON is the DD with userid and passwd (can use encrypted)
000007 //*SCR is the script that contains the MQConnector information
000008 //* to connect to an MQ Broker*
000009 //*UNVIN provides the payload for the SCRIPT in SCR*
000010 //************************************************************
000011 //*
000012 //*        JCLLIB ORDER=LIB.V3207.UNV.UNVCONF
000013 //*
000014 //UCMD     EXEC UCMDPRC
000015 //LOGON     DD DISP=SHR,DSN=USER123.UAC.LOGON(USER)
000016 //SCR       DD DISP=SHR,DSN=USER123.UAC.SCR(MQPUB)
000017 //UNVIN     DD DISP=SHR,DSN=USER123.UAC.PYL(MQPYL)
000018 //UNVOUT    DD SYSOUT=*
000019 //UNVERR    DD SYSOUT=*
000020 //SYSIN     DD  *
000021 -s scr
000022 -script_type SERVICE*
000023 -i ucaserver -f logon
```

Step 2	Create the MQ Connector Command Options Data Set Member.

This member contains the UCA for SOA command options for the MQ Connector that specifies the required information to submit a job to the MQ environment. It is referenced with the **SCR** ddname and has the following format:

```
-protocol mq
-mep Publish
-mqhost MQHOST
-mqqueuemanagername MyQueueManager
-mqqueuename UpsQaQueue
-mqchannel UpsQaChannel
-timeoutsec 120
```

> ⚠ **Note**
> If the port on which the MQ Broker is listening has been changed from its default value (1414), you must include the -mqport option to specify the current port.

Step 3	Create the Payload Data Set Member. This member contains the MQ message and is read in via STDIN.

> ⚠ **Note**
> The **LRECL** length depends on the job it describes. Verify that your data set member record length can accommodate the maximum line length of your message.

Example:

```
000001
000002 Hello...this is a payload in an MQ message.
```

Running a Universal Command Agent for SOA Job on UNIX Connecting

to MQ Connector

Step 1	Create the UCMD script file (**Mqopt**) to contain the the UCA for SOA command options for the MQ Connector that specifies the required information to submit a job to the MQ environment.

```
Mqopt contains:
-protocol mq
-mep Publish
-mqhost MQHOST
-mqqueuemanagername MyQueueManager
-mqqueuename UpsQaQueue
-mqchannel UpsQaChannel
-timeoutsec 120
```

> ⚠️ **Note**
> If the port on which the MQ Broker is listening has been changed from its default value (1414), you must include the -mqport option to specify the current port.

MQPayload.xml

```
Hello...this is a payload in an MQ message.*
```

Step 2	From a command prompt, execute the following command to send a message to an MQ Queue:

```
ucmd -script  Mqopt -script_type SERVICE -i ucaserver -u user -w user < MQPayload.xml
```

You can also execute the command using the Universal Command options for STDIN (**-I** for input and **-F** for file):

```
ucmd -script  Mqopt -script_type SERVICE -i ucaserver -u user -w user -I -F MQPayload.xml
```

Example output:
```
MQ message published successfully on destination UpsQaQueue.
```
